ANNUAL REPORT

OF THE

COUNTY MEDICAL OFFICER OF HEALTH

For the Year 1931,

BY

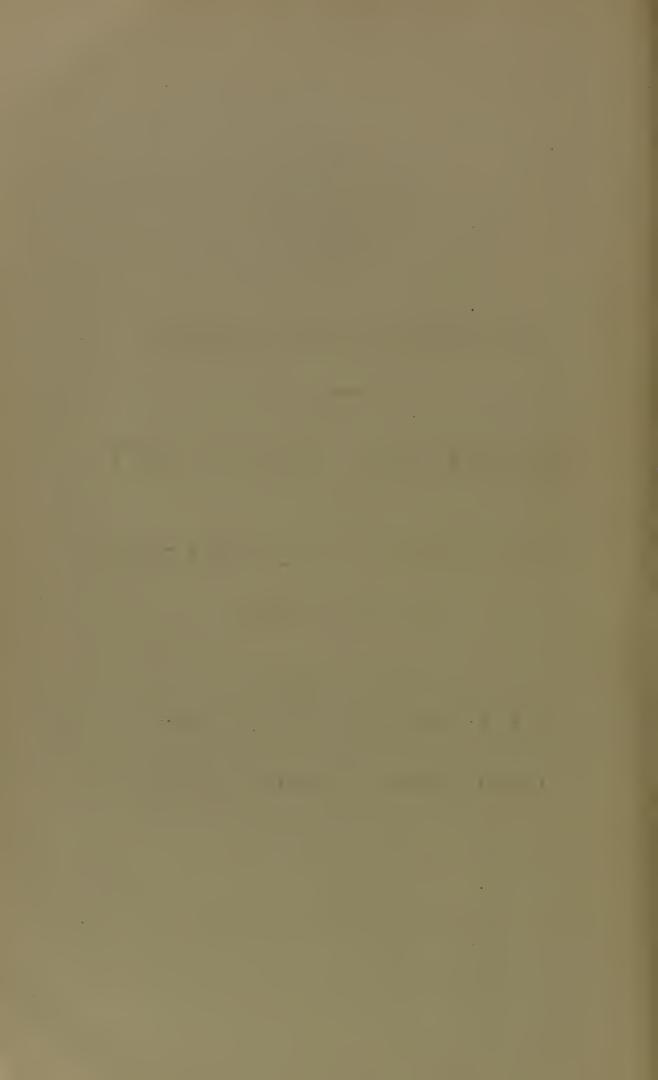

W. M. ASH,

M.B., B.S. (LOND.), F.R.C.S. (ED.), D.P.H. (VICT.),

COUNTY MEDICAL OFFICER OF HEALTH.

DERBY:

J. W. SIMPSON AND SONS, PRINTERS, FRIAR GATE.

To the Chairman and Members of the

Derbyshire County Council.

MY LORD DUKE, LADIES AND GENTLEMEN,

I have the honour to present to you the Forty-second Annua Report on the Health of the County of Derby.

The Report this year is the first of a series of four Interim Reports of a new five-yearly period. Last year was a "Survey" year and it will be remembered that the Report was of a comprehensive nature, set out in the form of a book of reference to the County Health Services. The present Report records any alterations made since the publication of the Survey Report and at the same time gives full statistical particulars of work done during the year 1931; otherwise, for reasons of economy, the Report has been reduced as much as possible.

The year has been an exceedingly difficult one, for while the financial circumstances make it almost impossible to proceed towards the realisation of the great possibilities for the improvement of the health services which were presented by the Local Government Act of 1929, it is equally impossible to stand still.

In conclusion I would like to acknowledge the help and consideration I have received from the Chairman and Members of my Committees, both collectively and individually, during the past year.

I am,

Your obedient Servant,

W. M. ASH,

County Medical Officer of Health

New County Offices,

St. Mary's Gate, Derby.

June, 1932.

PUBLIC HEALTH STAFF.

COUNTY MEDICAL OFFICER OF HEALTH:

W. M. Ash, M.B., B.S., F.R.C.S., D.P.H.

DEPUTY COUNTY MEDICAL OFFICER:

R. N. Curnow, M.B., B.S., M.R.C.S., D.P.H. (commenced 22/6/31).

TUBERCULOSIS OFFICERS:

- B. S. Nicholson, M.D., D.P.H.P. Heffernan, B.A., M.D., B.Ch., B.A.O.C. Kingston, M.R.C.S., L.R.C.P., D.P.H.

BACTERIOLOGIST:

Sheila M. Ross, M.D., B.Ch., D.P.H.

VENEREAL DISEASES OFFICER:

H. R. M. Richards, M.B., B.Ch. (part-time).

MEDICAL SUPERINTENDENT AT WALTON SANATORIUM:

A. N. Robertson, M.R.C.P., M.D., D.P.H.

ASSISTANT RESIDENT MEDICAL OFFICER AT WALTON SANATORIUM Vida Stark, M.B., Ch.B.

CONSULTING SURGEON, WALTON SANATORIUM:

- J. W. Tonks, M.D., F.R.C.S. (commenced 1/2/31) (Died 4/5/31). F. J. Milward, M.A., F.R.C.S. (commenced 20/7/31).
- CONSULTING SURGEON, BRETBY ORTHOPÆDIC HOSPITAL: Naughton Dunn, M.B., Ch.B.
- MEDICAL SUPERINTENDENT, BRETBY ORTHOPÆDIC HOSPITAL G. A. Q. Lennane, M.A., M.B., B.Ch.
- ASSISTANT RESIDENT MEDICAL OFFICER, BRETBY ORTHOPÆDIC HOSPITAL:

Elizabeth Grierson, M.B., Ch.B.

HON. CONSULTING RADIOLOGIST AND ELECTROLOGIST:

A. R. Laurie, M.B., Ch.B., D.M.R.E.

MATERNITY AND CHILD WELFARE OFFICER:

Edith E. Stephens, M.D., B.S. (resigned 31/10/31). Nellie Wilkes, M.B., Ch.B. (commenced 14/12/31).

CONSULTING OBSTETRICIANS:

- N. L. Edwards, F.R.C.S., Derby.
 H. T. Hicks, F.R.C.S., Derby.
 W. W. King, F.R.C.S., Sheffield.
 F. H. Lacey, M.D., Manchester.
 C. D. Lochrane, F.R.C.S., Derby.
 M. H. Phillips, F.R.C.S., Sheffield.
 C. E. Potter, M.D., Derby.

ASSISTANT SCHOOL MEDICAL AND M. AND C. W. OFFICERS:

- H. S. Bryan, M.R.C.S., L.R.C.P.,
 F. J. Burke, M.D., Ch.B.,
 Wilhelmina W. Hendry, M.B., B.Ch., D.P.H.,
 A. Maemillan, M.B., B.Ch., D.P.H.,
 Ethel W. Morris, M.R.C.S., L.R.C.P., D.P.H.,
 W. J. Pierce, M.B., Ch.B.,
 H. N. Panham, M.B. Ch.B.,
 H. N. Panham, M.B. Ch.B.,

- H N. Popham, M.B., Ch.B., B.S.,

OPHTHALMIC SURGEON (School Medical & M.C.W.):

T. E. A. Carr, M.B., B.S.

Public Health Staff—continued.

EAR, NOSE & THROAT SURGEON (School Medical & M.C.W.): Margaret S. Purce, M.B., B.Ch., F.R.C.S.

COUNTY ANALYST:

John White, F.I.C.

SENIOR DENTAL OFFICER (School Medical & M.C.W.): H. P. Suteliffe, L.D.S.

DENTAL OFFICERS:

M. Lewis, L.D.S., C. L. Noble, L.D.S., Elizabeth E. Grant, L.D.S., Doris M. Thomson, L.D.S., Christine B. Calder, L.D.S., Cicely Jefferson, L.D.S., Betty C. Hamilton, L.R.C.P. & S., L.D.S. (resigned 28/3/31). Flora M. Grant, L.D.S. (commenced 13/4/31). Josephine Dolan.

Also six Dental Attendants and three Dental Clerks.

ORGANISER OF INFANT WELFARE:

Miss E. Gray.

REGIONAL INSPECTORS OF MIDWIVES.

Miss Thorpe (resigned 25/4/31). Miss Culleton (commenced 27/5/31).
Miss Wilson,
Miss Woodford.

· ORTHOPÆDIC NURSES:

Miss E. Garratt, C.S.M. & M.G. Miss E. Taylor.

COUNTY SANITARY INSPECTORS:

H. Diekinson, Cert.R.S.I., Cert. Meat Inspector. H. Mallinson, Cert. R.S.I., Cert. Meat Inspector.

FOOD & DRUGS SAMPLING OFFICER: W. Etchells.

ASSISTANT BACTERIOLOGIST:

C. F. Peckham.

LABORATORY ASSISTANTS:

A. Morley, Cert. B.L.A., A. Yeomans, C. Robertson.

RADIOGRAPHER:

H. A. Wainscott, M.S.R.

CHIEF CLERK

T. O. Morrell.

CLERKS:

H. R. Pedley, H. Richardson, F. Beeston, Cert. S.I.B.,
H. Littlewood, H. Haddock, E. L. Eyre, E. J. Arnot,
L. A. Buttling, Miss Alexander, Miss Waller, Miss Booth. Miss Allsop (died 11/2/32), Miss Facer (commenced 16/2/32).

There are six part-time Officers in charge of Infant Welfare Centres. Details of these will be found in Table XXII.

There are 81 Public Vaccinators (including nine at Institutions) and 75 Poor Law District Medical Officers. All are engaged in private practice. There are also 19 Vaccination Officers.

There are seven subsidised mídwives.

[†] Deaths from Diarrhoa under 2 years or age only.

Report on the Health of Derbyshire for the Year 1931.

STATISTICS AND SOCIAL CONDITIONS.

AREA.

The Administrative County of Derby comprises 40 Sanitary Districts, four of which are Municipal Boroughs, 21 Urban Districts and 15 Rural Districts. According to the Census Return for 1931 the County has a total area of 640,701 acres, 92,588 in the Boroughs and Urban Districts and 548,113 in the Rural Districts.

POPULATION.

The population of the Administrative County at the time of the 1931 Census was 614,926, 316,440 in Borough and Urban Districts and 298,486 in Rural Districts. The Registrar-General's estimate of the population to the middle of 1931, on which the various calculations in this Report are based, is 618,500, *i.e.* 318,000 in Borough and Urban Districts and 300,500 in Rural Districts.

The estimated and the Census populations of each Sanitary District are given in Tables II. and IIa.

INHABITED HOUSES.

The estimated number of houses in the County at the end of 1931 was 152,113 of which 77,484 are in Boroughs and Urban Districts and 74,629 in the Rural Districts.

During 1931, 2,486 new houses were erected.

RATEABLE VALUE.

The Rateable Value of the Administrative County of Derby in April, 1931, for County Rate purposes was £2,665,597, and a Penny Rate over the whole County represents the sum of £10,307.

PHYSICAL FEATURES AND CHIEF OCCUPATIONS.

The main industries which give the people of this county occupation are coal mining, carried on in the East and North-East and in a small area in the South-Western portion of the county, and agriculture, particularly in the Western and Central parts of the county.

The staple industries in the extreme North-Western area of the county adjoining Lancashire are those connected with the cotton trade, whilst in the South-Eastern area adjoining Notting hamshire the lace trade provides the chief occupation. In this area, too, artificial silk manufactories absorb an appreciable portion of the population. In the Northern and North-Central areas the chief industries are quarrying, limestone crushing and lime burning, working and dressing millstone grit, and silica brick making. A number of these industries come under the heading of "Refractories Industries," some of which are known to be pre-disposed to pulmonary disease. As was pointed out in a Special Report on Silicosis appended to my Annual Report for 1926, the death rate from phthisis amongst workers in the refractories industries has been considerably reduced in this County.

In the extreme South-Western portion of the county, pottery manufacture is one of the prominent industries.

VITAL STATISTICS.

The Vital Statistics relating to each District in the County for the year under review are given in Tables II. and II(a). and the following are extracts from them, given in a form required by the Ministry of Health:—

Live \ \ Legitimate \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \		Females. 4,823 195	Total. 9,962 384	Rate per $1,000$ of population. $\left.\begin{array}{c} Rate & per \\ 1,000 & of \\ population. \end{array}\right.$

Infantile Mortality.—The Infantile Mortality rate for the year under review was 67.4 per 1,000 births, as compared with 61.45, the rate for the previous year. This rise is the same as that over the whole of England and Wales namely 6 per thousand in both instances.

Births.—The Birth Rate for the year was 16.72 per 1,000 of the population as compared with 16.92, the rate for 1930. The numbers of registered live and still births among males and

Deaths.—6,855 deaths occurred during the year, giving a death rate of 11.08 per thousand of the population, as compared with 10.15, the rate for the previous year.

Zymotic Diseases.—The Zymotic Death Rate for the year was 0.24 per thousand of the population, as compared with 0.34, the rate for 1930. The Zymotic Death Rate for the year under review is the lowest yet recorded in Derbyshire.

NURSING IN THE HOME.

General.—General nursing in the homes of the people is carried ont over the greater part of the County through the agencies of District Nursing Associations, the majority of which are affiliated with the Derby County Nursing Association. These affiliated Associations number 79 and employ 98 nurses (30 Queen's Nurses and 68 District Nurse Midwives). I have no accurate information as to the number of Associations not affiliated to the Derby County Nursing Association.

Under Section 101 of the Local Government Act, 1929, the County Nursing Association receives a Grant of £1,400 per annum for the financial year ended March, 1932. The County Council are under an obligation to pay this Grant till the end of the financial year 1934. The Grant is made with a recommendation that the County Nursing Association should allocate the money partly towards the administrative expenses of the County Nursing Association, partly for the training of midwives and providing post-graduate courses for them, and for the greater part as Grants to District Nursing Associations providing midwifery and maternity services, the object of the Grant largely being to assist in the maintenance of a midwife to exist in private practice, such for instance as in sparsely populated agricultural rural areas.

The County Council has arrangements with the Derby County Nursing Association for the nursing of bedridden cases of tuberculosis in their own homes. During the year 1931, this service was provided in twelve instances.

Midwives.—During 1931, seven midwives received subsidies ranging from £15 to £50 per annum. On December 31st, 1931, the number of subsidised midwives was seven.

The total number of midwives practising in the area at the end of 1931 was 300. Further particulars of the midwifery service is given under the heading of Maternity and Child Welfare, on page 35 of this Report.

HEALTH EDUCATION.

Health Week.—Health Week for Derbyshire was held from October 4th to 10th, 1931, during National Health Week. The Derbyshire Health Week Committee is composed of representatives of practically all the voluntary organisations, as well as of representatives of the Derbyshire Education Committee, the County Council and the Boroughs, Urban and Rural Councils throughout the County. In addition, the following bodies co-operate with the Health Week Committee to give emphasis to the teaching of cleanliness, dieting, sanitation, ventilation and the cultivation of proper habits —

The Royal Sanitary Institute.

The Central Council for Health Education.

The Health and Cleanliness Council.

The Dental Board of the United Kingdom.

The Empire Marketing Board.

The National Milk Publicity Council.

The Mutual Property Insurance Co., Ltd.

The Food Education Society.

The Fruit Trades Federations.

The National Baby Week Council.

During Health Week, special addresses were given in all the day schools by the teaching staff, the school doctors, dentists, health visitors and medical practitioners. In addition, about 35,000 children from 236 schools attended picture houses where health films were shewn.

Lectures were arranged by the Red Cross Society. Films and lantern slides were shewn in picture houses in the evenings, and a considerable quantity of literature was distributed to the schools, Women's Institutes, etc.

GENERAL PROVISION OF HEALTH SERVICES FOR THE AREA.

LOCAL GOVERNMENT ACT, 1929.

Section 5 (1).—No essential alterations have been made during the year in the arrangements for the discharge of the medical services transferred to the County Council under the provisions of this Act.

Section 13.—This Section places upon the County Council the obligation in discharge of the functions transferred to the County Council under Part I. of the Act to consult a Committee representative of governing bodies of medical and surgical staffs of voluntary hospitals when making provision for hospital accommodation in or for the benefit of the County.

The voluntary hospitals formed a representative Committee whilst the County Council appointed a special Hospital Accommodation Sub-Committee representing the various Committees of the ('ounty ('ouncil to whom it falls to provide hospital accommoda-These two Committees met at the Derbyshire Royal Infirmary on February 11th, 1932. It was then recognised that at one meeting concrete schemes could not be formulated, and the meeting largely consisted of an address by myself, in which I explained the powers of the County Council with regard to the provision of hospital accommodation for the sick within their area, and then, having stressed the point that the views which I was going to place before the Committee were my own personal views and must not be taken as committing the County Council, proceeded to visualise broadly what I considered a feasible scheme for the provision of hospital accommodation within the County. To anyone who has read my Annual Reports of the last two years. my ideas on this subject should be clear, and my proposals at the meeting were largely a reiteration of what I said in those reports, and I need say no more here than to re-state my opinion that there is no need for competition between voluntary and municipal hospitals—there is ample work for both to do, and, with a broad outlook of the problems on both sides, there should be no difficulty in developing a comprehensive hospital system which would provide accommodation for the acute and chronic sick, the aged and the In forming our conclusions in this very difficult subject. we must not forget the needs of the sick, and particularly the chronie sick, who are apt to be overlooked: nor must we forget the value of the great traditions behind the voluntary hospitals, an under-estimation of which would be disastrous.

Arrangements, however, have been made for the effective cooperation of the medical staff of other services in the County, particularly specialised services, to be available to the Public Assistance Committee in discharge of their duties for the treatment of the sick in Public Assistance Institutions. In this way the services of the County gynæcological and obstetric, orthopædic, aural, ophthalmic specialist officers are available for consultation with the medical officers of Public Assistance Institutions, whilst the X-Ray plants in various parts of the County for the purpose of the Tuberculosis Committee are also available for Public Assistance cases.

PUBLIC ASSISTANCE INSTITUTIONS.

The following Table gives information regarding the accommodation provided at the Public Assistance Institutions within the County and the extent to which they were used during 1931:—

MATERNITY HOMES.

Buxton Hospital District.

23

14930

Buxton (Boro')

20

25

21

The County Council provide a Maternity Home at Ashbourne, and have contracted with the Chesterfield Corporation for the use of four beds at the Chesterfield Maternity Home, with the Nightingale Home, Derby, for the use of two beds, with the Women's Hospital, Derby, and with the Wirksworth Cottage Hospital.

The Maternity Home at Ripley, which had provided accommodation for some 180 cases per annum, was closed in June, 1931, on account of the unsuitability of the premises for further use as a maternity home. No alternative accommodation has been acquired at the time of writing.

Ashbourne.—During the year 1931, 149 cases were admitted to this Home. Of these, 141 were delivered by midwives and 7 by doctors.

During the financial year ended March 31st, 1932, the number of patients admitted to this Home was 134, the percentage of beds occupied being 59¹1. The gross cost during that year was £1,695 (including £525 for repayment of loan and interest and other capital charges). The sum of £647 was received as fecs from patients, leaving a net cost to the County Council of £1,048.

Ripley.—During the period from January 1st, 1931, until the date of its closure, 41 patients were admitted to this Home. Of these, 29 were delivered by midwives and 11 by doctors.

From April 1st, 1931, to June 15th, 1931, the number of admissions to the Home was 19.

Chesterfield.—During the year 1931, 168 cases were admitted to this Home from the County, of whom 62 were normal cases paying the full fee.

Nightingale Home.—During the year 1931, 4 cases were admitted to this Home from the County area, under the agreement between the County Council and the Authorities of the Home.

With the exception of the Nightingale Home, each of the abovementioned Homes provides accommodation for unmarried mothers, but for the first confinement only. For subsequent confinements the unmarried mother can be provided with accommodation at most of the Public Assistance Institutions,

Womens' Hospital, Derby.—During 1931, 11 cases were admitted, 10 of which were cases of Puerperal Fever.

Wirksworth Cottage Hospital.—45 cases were admitted to this Hospital during the calendar year 1931. During the year ended March 31st, 1932, 47 cases were admitted to the Hospital, and 15 were treated in the district. Of the 47 cases in the Hospital, 35 were delivered by midwives and 12 by doctors; of the other 15, 12 were delivered by midwives and 3 by doctors. The cost to the County Council was £31.

Public Assistance Institutions.

The following Table shews the number of beds at each of the Public Assistance Institutions and the number of cases accommodated in them during 1931:—

		Cases	Average	Case	s delivered.	Occasions Medical Aid

TUBERCULOSIS HOSPITALS.

Four hospitals for the accommodation of cases of tuberculosis are maintained by the County Council, namely:—

- 1. Walton Sanatorium.
- 2. Penmore Pavilion.
- 3. Bretby Hall Orthopædic Hospital.
- 4. Whitworth Hospital.

At Walton Sanatorium, accommodation is provided for 124 patients, *i.e.*, 74 beds for males and 50 for females, with an additional ten shelter beds for use during the summer time.

The Pavilion at Penmore provides accommodation for 14 females suffering from advanced pulmonary tuberculosis, with four additional shelter beds for use during the summer time.

Bretby Hall has 55 beds for surgical tuberculosis in children and 32 beds for adult patients of both sexes suffering from surgical tuberculosis

The accommodation for tuberculosis cases at Whitworth Hospital consists of a detached block of six beds for the accommodation of males suffering from advanced pulmonary tuberculosis.

Further information concerning the work at these Institutions during the year will be found on pages 92-126.

ORTHOPÆDIC HOSPITALS.

Reference to Table IV. shows the Voluntary Hospitals in the County with orthopædie departments.

The County Council has its own Orthopædic Hospital at Bretby Hall, where, in addition to orthopædic cases of a tuberculous nature, there is accommodation for 50 orthopædic cases of non-tubercular origin.

Run in conjunction with Bretby Hall and functioning in the capacity of out-patient departments are nine orthopædie clinics; which are under the charge of the resident medical superintendent at Bretby. A list of these is given on pages 52-53 of the last Annual Report, but the following amendment should be made to the list:—

Bakewell and Belper Clinics closed.

A Clinic opened at Dean Hill House, Matlock, every Tuesday, 9.30 to 12.30 and 2.0 to 4.0 p.m. The orthopædic surgeon attends on the first Tuesday in each month.

PUERPERAL FEVER AND PUERPERAL PYREXIA HOSPITAL ACCOMMODATION.

Full particulars of the County Council's arrangements under the Puerperal Fever and Puerperal Pyrexia Regulations, 1926, for the treatment of these conditions were set out in the Annual Report for 1930, pages 54 and 62-64.

OPHTHALMIA NEONATORUM HOSPITAL ACCOMMODATION.

Beds are available as required for the accommodation of the mother as well as the child at the Derbyshire Royal Infirmary, Derby.

MENTAL DEFICIENCY INSTITUTIONS.

The County Council have one small block in connection with the Glossop Public Assistance Institution, certified by the Board of Control for the accommodation of nine males and twelve females, whilst the Chesterfield Public Assistance Institution is certified for the reception of one female case. This accommodation is always fully occupied. Apart from this the County Council provide accommodation by contracting with certified institutions not belonging to the County Council, in which, at the end of 1931, there were accommodated for the Council 43 males and 138 females.*

^{*} Whilst this Report was going to print, the County Council decided to purchase Makeney House, near Belper, as an Institution for high-grade mentally defective females. This property should accommodate about 80 eases.

VENEREAL DISEASES CLINICS.

The County Council maintain Venereal Diseases Clinies at the Chesterfield and North Derbyshire Royal Hospital and the Derbyshire Royal Infirmary, Derby. The number of beds provided for in-patient treatment of the disease at these two Institutions is as follows:—

	Males.	Females.	Total,
Chesterfield & North Derbyshire			
Royal Hospital	l	1	2
Derbyshire Royal Infirmary	2	2	4.

Clinics are held at these Institutions at the following times:—

TABLE VII.

Males.	Females.

BACTERIOLOGICAL LABORATORY FACILITIES.

There have been no changes during the year in the Bacteriological Laboratory arrangements except the following in the Scale of Charges which was set out on page 30 of the Annual Report for 1930:—

During the year, 13,967 bacteriological examinations were made at the County Laboratory, compared with 16,989 in the previous year. The following Table shows the origin of the specimens:—

TABLE XI.

Tubercle in Milk.

During the year 1108 samples of milk were examined for the presence of tubcrcle bacilli by animal inoculation. 138 samples, or 12.45 per cent. were found to contain tubercle bacilli. The 1108 samples included 180 from Derby Borough. It should be explained that some of these samples were taken in the process of detecting the offending animal in a herd from which a mixed milk has already been found to contain Tubercle Bacilli.

During 1931, 490 samples of milk were submitted for bacterial count. Of this number 364 came within the limits of Grade "A" milk.

The following Table gives details of the examinations:—

TABLE XVIII.

	Up to 10,000.	Over 10,000 and up to 20,000.	Over 20,000 and up to 50,000.	Over 50,000 and up to 100,000.	and up to	Over 200,000 and up to 1,000,000	Over 1,000,000.	Uncountable.

REPTON AND GRESLEY.	Swadlincote.	Swadlincote 10 or 92.	The Swadlineote Urban District Council have a horse-drawn ambulance which will accommodate four sitting and two stretcher cases.
REPTON AND GRESLEY.	Gresley.	Swadlincote 133.	Grosley Colliery Ambulance (Red Cross Society) is a 20-H.P. G.M.C. with accommodation for eight sitting and four stretcher cases.
	Burton.	Burton 1.	Burton Corporation Ambulance is an 18-H.P. Guy with accommodation for two stretcher cases and four or five sitting cases. It is equipped with all modern appliances.
RIPLEY.	Ripléy,	Ripley 60.	Britain Colliery Ambulance is a 28-H.P. Buick with accommodation for two stretcher cases, and is available when not required for colliery cases.

MATERNITY AND CHILD WELFARE.

MIDWIVES ACTS, 1902—1926.

Number of Midwives.—At the end of 1931 there were 300 midwives on the County Roll. 251 were trained midwives and of these, 73 were District Nurse-Midwives.

The following changes of midwives took place during the	year.
Deaths of Midwives	4
No. of trained midwives who have left the County, of	
whom 9 were District Nurse-Midwives	28
No. who have done temporary duty for District nurses	22
No. of new Midwives enrolled	23

Deaths following Child-Birth.—During 1931, information was received concerning 52 women who died following child-birth. The causes of death were as follows:—

Puerperal Fever			 14
Toxæmia	•••	•••	 8
Kidney Conditions		• • •	 5
Hæmorrhage	•••		 3
Cardiac Conditions			 9
Pulmonary Embolism			 2
Respiratory Conditions			 6
Various			 5

f these deaths, 35 occurred in hospitals or maternity homes.

Records Received.—The following Table gives the records received, the cases of Puerperal Fever and Puerperal Pyrexia in the practice of midwives only, and all cases of Ophthalmia Neonatorum, whether in the practice of doctors or midwives, with the corresponding figures for previous years:—

	1924	1925	1926	1927	1928	1929	1930	1931

Special Letters of Warning.—Eight special letters of warning were sent to midwives in the County for breaking the rules of the Central Midwives Board.

Puerperal Fever.—The following table shews the number of cases of Puerperal Fever which occurred in the practice of midwives during 1931:—

	Number of Midwives.	Number of Confinements.	Puerperal Fever Cases.	Cases per 1,000 Births.
Bona-fide Midwives	49	860	1	1.16
Trained Midwives, including District Nurse-Midwives	2 51	5245	16	3.05
	300	6105	17	2.78

Puerperal Fever and Puerperal Pyrexia.—The following table shews the total number of cases of Puerperal Fever and Puerperal

Pyrexia notified to me during the year 1931 and the case rate from each of these diseases per 1,000 births:—

	Who	ole County.	$M.C.W.\ Area.$
Number of births	•••	10,346	8,192

	No.	of Cases.	Case rate per 1,000 births.		
Disease.	Whole County.	M.C.W. Area.	Whole County.	M.C.W. Area.	
Puerperal Fever Puerperal Pyrexia	30 66	26 61	$\begin{array}{c} 2.87 \\ 6.37 \end{array}$	3·17 7·44	

The number of cases admitted to hospitals under the County Council Puerperal Fever and Puerperal Pyrexia Scheme during 1931 was as follows:—

Derbyshire Royal Infirmary	• • •	11
Jessop Hospital for Women		7
Burton upon Trent General Infirmary	• • • •	
High Peak Isolation Hospital		_
Victoria Hospital, Worksop		1
Derbyshire Hospital for Women		10

A Consultant's opinion was requested in 9 cases, and was immediately provided.

Consultants.—The names of the Consultants and the Centres from which they work appear at the beginning of this Report under the heading "Public Health Staff."

Ophthalmia Neonatorum.—The incidence of Ophthalmia Neonatorum during the year and the results of treatment are set out in the following table:—

	Cases	Treated.	•		Total	No of
Notified.	At Homė.		$Vision \ unimpaired$	Vision impaired.	Blind-	$egin{array}{c} No. of \ Deaths. \end{array}$

*—In September, 1930, the Borough of Chesterfield became a Local Supervising Authority and after that date the figures do not include those for the Borough of Chesterfield.

N.B.—The figures on the left-hand side of the Table refer to the Calendar years ending December 31st, whilst the figures on the right-hand side refer to the financial years ending in the following March.

Maternal Mortality.—The maternal mortality rate for the County (excluding the Borough of Chesterfield) for the year 1931 was 4 55 per thousand births.

The following Table gives the Maternal Mortality rate in the County since 1916:—

TABLE XXI.

Year	Deaths from Puerperal Fever.	Rate per 1000 Births	Deaths from other acci- dents and Diseases of Pregnancy & Parturition	Rate per 1000 Births.	Total.	Rate per 1000 Births	No. of Births.
1916	19	1.45	45	3.43	64	4.88	13,109
1917	14	1.18	33	2.79	47	3.97	11,831
1918	10	·82	27	2.23	37	3.05	12,103
1919	15	1.26	40	3.38	55	4.64	11,838
1920	22	1.41	45	2.89	67	4.30	15,572
1921	12	-83	33	2.29	45	3.12	14,417
1922	17	1.30	35	2.67	52	3.97	13,095
1923	18	1.42	46	3.62	64	5.04	12,681
1924	17	1.34	32	2·53	49	3.87	12,615
1925	17	1.36	31	2.48	48	3.84	12,491
1926	18	1.52	36	3.04	54	4.56	11,845
1927	16	1.43	40	3.57	56	5.00	11,194
1928	21	1.89	27	2.43	48	4.32	11,112
1929	18	1.73	21	2.02	39	3.75	10,394
1930	18	1.70	26	2.46	44	4.16	10,562
1931	18	1.95	24	2.60	42	4.22	9,231

As the Corporation of Chesterfield became the Local Supervising Authority for their own area in 1930, the figures for this Borough are not included since then.

Compensation to Midwives.—During the year 1931, four elaims were received for compensation to midwives for loss of practice during suspension, and the amount paid was £5–15s, 6d.

Payment of Doctors' Fees under Section 14(1) of the Midwives Act.—In respect of the financial year ended March 31st, 1932, 776 claims were received from medical practitioners. Of these 737 were passed for payment amounting to £1,274 the remainder being disallowed as not complying with the conditions laid down by the Midwives Acts and the Ministry of Health or being cancelled by doctors previous to payment. Amount refunded for the same period totalled £478.

Provision of Free Milk. In respect of the financial year ended March 31st, 1932, 167 applications for free milk were received. Of these 7 were not granted. The expenditure was £51 2s. 0d. for fresh milk and £10 for dried milk.

NURSING HOMES REGISTRATION ACT.

During the year 1931, four applications for registration of premises were received. One was refused on account of unsuitability of premises, one was refused on account of unsuitability of staff; two were granted. The keepers of the two which were granted had applied for the registration of fresh premises.

At the end of 1931 there were 14 Homes on the County Register, as follows :—

General Nursing F	lomes		•••	 4
Maternity Homes				 6
Mixed General and	Mater	nity I	Homes	 4

MEDICAL TREATMENT OF CHILDREN UNDER FIVE YEARS OF AGE.

There is available for children coming within the scope of the Child Welfare Committee, the treatment of minor ailments, ear, nose and throat conditions, eye conditions, dental conditions and orthopædic treatment for both in-patients and out-patients—the in-patients being treated at Bretby Hall Orthopædic Hospital.

The number of children coming for such treatment during the year 1931 was as follows:—

Ear, nose and throa	t eoi	nditions	 	199
Eye conditions			 	60
Dental conditions			 	1,129
Orthopædic treatme	ent—	_		
In-Patients			 	38
Out-Patients			 	193

INFANT LIFE PROTECTION.

Under the scheme for the supervision of infants under seven years of age who are received for reward, there were 85 children on the register on December 31, 1931, and 331 visits were paid by the Health Visitors to them during the year. In four cases where the conditions were unsatisfactory we were successful in securing other accommodation.

BOARDED-OUT CHILDREN.

The supervision of boarded-out children is being carried out on behalf of the Public Assistance Committee by the Maternity and Child Welfare staff. Except in the sparsely populated north-west area of the County, where the work is done by the Health Visitors, the service is in the hands of the Regional Inspectors of Midwives. In this connection, 1,066 visits have been paid to 100 children.

HEALTH VISITING IN THE HOMES.

A summary of the work done by the Health Visitors during 1931 will be found in Table XLIII., pages 128-129.

CLINICS AND TREATMENT CENTRES.

The Maternity and Child Welfare area of the County Council comprises the whole of the Administrative County, with the exception of the four Boroughs—Buxton, Chesterfield, Glossop, and Ilkeston—and the scheme provides 48 Centres, 18 in Urban Districts and 30 in Rural Districts. Most of the Centres are under the supervision of a doctor and a health visitor is in attendance at each session.

Details of these Centres are set out in the following Table:-

^{*} Opened October, 1931.

Owing to the very limited staff at my disposal towards the end of the year, it was found necessary, in order that the larger Centres should have adequate medical supervision, to reduce the Centres at Drayeott, Duffield, Sandiaere, Sawley, Somereotes, and Unstone to Weighing Centres at which no doctor attends, whilst at Marchay Centre medical attendance was limited to a monthly attendance.

During the year a new Child Welfare Centre was opened at Norton, and early in 1932 a Weighing Centre was opened at Chinley.

We also received intimation that the Voluntary Infant Welfare Centre held at Clifton, to which the County Council were paying a small grant, would be permanently closed on April 1st, 1932.

Voluntary Infant Welfare Centres.—During the financial year ended March 31st, 1932, 3 Voluntary Infant Welfare Centres received a Grant of £10 each from the County Council, namely:—Ashford, Mickleover and Bradwell.

Ante-Natal Scheme.—The following Table gives details as to the sessions and attendances at the various Ante-Natal Centres during 1931:—

^{*} Opened March, 1931.

The Ante-Natal Clinic at Ashbourne is run in connection with the Maternity Home.

A list of the days and times of holding the Ante-Natal Clinies will be found on page 74 of the Annual Report for 1930. The only alteration to that list is that the Ripley Centre is closed consequent upon the closing of the Ripley Maternity Home where the Centre was held.

During the year we lost the services of Dr. Edith Stephens, who has taken up private practice near London. Dr. Stephens was the first Medical Officer appointed to take charge of the Ante-Natal Clinics, and I would like here to express my appreciation of her untiring efforts for the good of the service.

On relinquishing her post, Dr. Stephens wrote me a very interesting report on the Ante-Natal work of the County during the time she had been looking after it, *i.e.*, from August, 1928, to October, 1931.

The report is of a technical character, but the following extract from it gives an idea of the type of case that attended the Centres:—

[†] Closed during 1931.

EXTRACT FROM DR. STEPHENS REPORT.

A resumé of 3,164 ante-natal eases examined at the Clinies of the Derbyshire County Council between August, 1928, and October, 1931:—

The following Table shows the results of parturition so far as could be ascertained from the midwife, doetor, or hospital. Information was obtained from the midwife at her attendance at the clinic with her patients, or if the midwife did not subsequently attend, she was sent a communication asking for details of the

confinement. As many of the midwives were of the bona-fide type, these results cannot be regarded as strictly accurate, but are a rough guide as to the results of ante-natal care:—

	Primi- paræ.	Multi- paræ.	Total.

Forceps rate: Primigravide	10%		,
Multiparæ	2.36%		
Total	5.7%		
10001	70		

In this series of 2,806 ante-natal cases there was a total of seven deaths, which gives a death rate of 2.49 per thousand. Among

primigravidæ there were six deaths; among the multiparæ one The causes of death were as follows :-

Double mitral disease ... 2 Primigravidæ. Puerperal fever ... 3 ...

One forceps delivery—severe laceration.

One forceps delivery followed by piecemeal removal of the placenta and severe secondary hæmorrhage in the puerperium.

One normal delivery.

Post-partum hæmorrhage ... One primigravida. Sudden death after a normal delivery.

Sudden death on the 18th day of the puerperium; no doctor in attendance; no inquest. One multipara.

Puerperal fever death rate ... 1.06 per 1,000. Other cases $\dots 1.42 \text{ per } 1,000,$

The three deaths from puerperal fever occurred among women who had attended the ante-natal Clinics regularly, and they were all seen at the 38th week of pregnancy. The ante-natal condition was satisfactory in all cases, and the women were all young and in good health. The two who were delivered with forceps had normal pelvic measurements, and the feetal heads were deeply engaged at the 38th week of pregnancy. In neither case was the forceps delivery difficult, and the babies were born alive.

School Clinics.—Full particulars of the School Clinics were given in my last Annual Report (pages 75-78). The following alterations were made during 1931 :—

- (1) MINOR AILMENT CLINICS.—An additional Minor Ailment Clinic has been opened at Stavelcy Middlecroft School, on Wednesdays, at 2 p.m.
- (2) EAR, NOSE AND THROAT.—('hesterfield ('linic was used for operations on the first as well as the second, third, and fourth Tuesdays each month. At Chinley, the Clinic is opened on the second Wednesday in each month for operations, instead of the first Tuesday, and Derby (linic has been discontinued on the second Wednesday in the month.
- (3) Dental Clinics.—The Dental Clinic at Bakewell Liberal Club has been discontinued. An extra Clinic at Matlock, held on the fourth Monday in each month, has taken its place.
- (4) ULTRA VIOLET LIGHT CLINIC.—In the Central Office there is a small Ultra Violet Light (linic which has been used for some years for the treatment of children suffering from some temporary disability likely to be improved by heliotherapy. This clinic is only occasionally used during the winter months, and is closed during the summer. During the year, 10 children were treated, four suffering from enlarged glands in the neck, three from malnutrition, and three from discharging ears.

Tuberculosis Dispensaries.—A list of the Tuberculosis Dispensaries was given on page 79 of the Annual Report for 1930. The only alteration during the year was that the Derby Dispensary was closed in June, 1931, when the premises were required for office accommodation for the Highways Department.

Venereal Diseases Clinic.—See page 25.

Child Guidance Clinic is held at Dean Hill House, Matlock, on Fridays.

SANITARY CIRCUMSTANCES OF THE AREA.

WATER SUPPLIES.

Full details of the various water supplies in the County were given in the Annual Report for 1930. Where any alterations or extensions have taken place, the particulars are given below:—

Urban Districts.

ALFRETON.—A 9in, bore-hole has been made at Lea, 500ft, deep, in the millstone grit and shale, and a test pumping by means of an air lift has given 564,000 gallons per day, and it is believed that several million gallons per day will be available by a larger borehole. The water is very pure from a baeteriological point of view, and chemical analysis also shows it to be satisfactory, the total hardness being only 7:14 parts per 100,000.

Bolsover and Chesterfield Borough.—These two Authorities are at present promoting a Parliamentary Bill for the formation of a Joint Water Board. At Bolsover a water-softening plant was installed near the water tower at Hillstown, and was officially opened on June 17th, 1931. The plant, installed by Messrs. Kennieott Water Softeners Company, Ltd., of Wolverhampton, operates on the Base Exchange principle, and consists of three 9 feet diameter units, each unit guaranteed to deliver 25,000 gallons of zero hardness water between regenerations.

Heanor and Ilkeston (Ilkeston and Heanor Water Board).— Following an Inquiry for sanction to a loan of £76.986, held on December 5th, 1930, a new pumping main from the waterworks to Chadwick Nick Reservoir and the gravitation main from the reservoir as far as Ripley have been completed. The laying of the remainder of the gravitation main from Ripley to Codnor is well in hand. The new boiler house is completed, and the work of constructing the extra pump house is in progress.

The increase in the quantity of water supplied by the Board is shewn by the following figures:—

Year.		No.	of gallons supplied.
1906	 		276,248,000
1910	 		379,774,000
1925	 		582,093,000
1930 -	 		646,460,000
1931	 		658,788,300

During the year, negotiations were entered into with the Chesterfield Rural District Council for a supply of approximately 150,000 gallons per day to the southern area of the Rural District, and a scheme has been prepared by the Rural District Council's Water Engineer.

During the year under review, a new sewer has been laid from Middleton to Wirksworth to take the sewage to the Wirksworth sewage works instead of allowing it to pass into the old lead mine shafts, the water from which is used by the Board.

A new reservoir is now being constructed at Codnor by the Heanor Urban District Council at a cost of £12,250. The reservoir will be circular in plan. 6 feet in the ground, and 20 feet above ground, the top water level being 515 o.d. It is to be built of reinforced concrete and roofed over, having 4" of loose gravel spread on top. The capacity will be 1,300,000 gallons.

The Borough of Ilkeston proposes to increase the storage capacity for water. The proposals are to construct a new reservoir at Hassock Lane End. having a capacity of 2,000,000 gallons and a top water level of 404 o.d., i.e., about 20 feet higher than the present reservoirs at Woodside. The reservoir will be octagonal in plan, 165 feet in diameter, and roofed over. The new length of main will connect up the old reservoirs, and arrangements are to be made so that any of the reservoirs can be by-passed as required. The amount of loan asked for was £30,000.

The existing and proposed reservoirs in the Ilkeston and Heanor Water Board's system are:—

	Presen Reservo	1	Proposed Reservoirs.		
	Capacity.	Capacity. O.D.		O.D.	
Chadwick Nick	1,300,000	700			
Tagg Hill	200,000	428	_		
Codnor Woodside	390,000	489	1,300,000	515	
(Shipley 2)	950,000	382	2,000,000	404	
Total	2.840,000		3,300,000		

NEW MILLS.—The New Mills Urban District Council have agreed to take 25,000 gallons per day from the new Stockport main which is now being laid in connection with the Goyt Valley water scheme.

In order to provide a supply of water to the higher parts of New Mills, the Urban District Council applied to the Ministry of Health for sanction to a loan of £7,400, but the scheme was not approved by the Ministry for the purposes of a loan.

SWADLINCOTE.—This district is supplied by the Swadlincote and Ashby Joint Water Committee with water from Milton. During the year a new reservoir of 3,000,000 gallons capacity with a top water level of 570·37 o.d., situated at Manchester Lane, Boundary, was completed.

Rural Districts.

BLACKWELL.—Good progress has been made with the work in connection with the new scheme for obtaining water from the Dukeries area for the supply of the main portion of the Blackwell Rural District. The boreholes and reservoirs are completed and one pumping station is finished. The whole of the new mains and supply mains in Hardstoft and Astwith have been laid.

CHESTERFIELD.—A scheme for improving the water supply to the southern area of this district was prepared by the Council's Water Engineer during the year. It is proposed to take a supply of 150,000 gallons per day from the Chadwick Nick reservoir of the Ilkeston and Heanor Water Board and convey it by means of a 12" main to a new reservoir to be built near Hardstoft.

RIVER POLLUTION AND SEWAGE PURIFICATION.

Urban Districts.

Alfreton.—An additional filter was constructed at Highfield sewage works during the year. There is still no treatment of sewage at Ironville.

Bakewell.—No sewage works have yet been provided for Bakewell.

Belper.—A scheme for considerably enlarging the Belper sewage works is in progress, consisting of extra settling tanks, filters, and sludge beds. The air compressors are now worked automatically by electricity during the periods when steam from the destructor is not available.

Bolsover.—Sewer extensions at Shuttlewood have enabled several cesspools to be done away with.

Buxton Borough.—Improvements are being carried out at these sewage works. The work consists of new detritus tanks, alteration to the storm overflow, and the provision of a flow recorder.

CHESTERFIELD BOROUGH.—There is still difficulty in treating the sewage at these works. At present, about one-third of the flow is passed to the river Rother as chlorinated tank effluent. A seheme for the provision of four sludge digestion tanks and numerous sludge drying beds is well in hand. When this part of the work is done, the construction of a further large bio-æration unit (the fourth) will be commenced.

CLAY CROSS.—The media of all the filters at both Danesmoor and Bacon Springs sewage works has been renewed. At Danesmoor the settling tanks have been improved and extra sludge beds provided.

HEAGE.—Some considerable delay has taken place in the completion of the sewage works for the Saw Mills and Ambergate areas in this district. An application was made to the Ministry of Health for the compulsory purchase of lands for the new works and pumping station. At the inquiry, held on April 24th, 1931, objections were raised to the sites selected for the sewage works, and the Ambergate pumping station and alternative sites were suggested. The Saw Mills length of sewer and this pumping station are already constructed.

HEANOR.—The new sewage works at Langley Mill are expected to be in use by July, 1932. The new scheme will consist of four detritus tanks, five settling tanks, ten filters, two storm water tanks, two humus tanks, and a set of sludge beds, and will do away with the old works at Commonside, Loscoe, Woodend, and Langley Mill.

ILKESTON.—The enlargement of these sewage works by the addition of a set of four filters, several sludge drying beds, a humus tank, and further settling tank capacity, is in progress.

Lone Eaton.—An Inquiry was held on December 11th, 1931, for sanction to a loan of £8,300 for the purpose of enlarging the present sewage works to deal with the sewage from parts of Toton, Chilwell, and Attenborough. The sewage from these areas which are in Nottinghamshire will be lifted by automatic electrical pumps. The enlargement will consist of an extra detritus tank, a settling tank, two filters, two humus tanks, and six sludge drying beds. A recorder is to be provided for the sewage flow from outside the Urban District.

MATLOCKS.—During 1931 an inspection was made of the River Derwent, and a report was sent to the Urban District Council, pointing out the various sources of pollution both by drainage and solid matter. Steps are being taken to remedy most of these complaints.

The following outlying districts have been sewered:—Matlock Moor, Lumsdale, Tansley, Matlock Cliff, Astor Lane, and Derby Road (Cromford). A recorder has been provided at the sewage works.

NORTH DARLEY.—Nothing has yet been done to provide proper sewage disposal works for this district.

RIPLEY.—A scheme for providing entirely new sewage disposal works on a new site was the subject of an Inquiry held on July 8th, 1931, when application was made for sanction to a loan of £29.298. I am informed that sanction to this loan has not been received, and therefore the scheme will not be proceeded with.

SWADLINCOTE.—A large scheme to provide new sewage works at Stanton for the greater part of this district is not to be proceeded with at present owing to the loan of £50,350 not receiving the sanction of the Ministry of Health. The scheme was to provide a new steel main outfall sewer, two detritus tanks, four settling tanks, two storm water tanks, four circular filters, two humus tanks, and twelve sludge beds. The present scheme consists of tanks and land treatment only.

Wirksworth.—The connecting up of Middleton-by-Wirksworth to the Wirksworth sewers necessitated the addition of an extra filter, humus tanks, and dosing chamber to the Wirksworth works. All these additions are now completed and in operation.

Rural Districts.

ASHBOURNE.

Hognaston.—In July, 1931, an application was before the Ministry for a loan of £500 for a small sewage works for this village. Sanction, however, was not obtained, and it is now proposed to construct a small tank with irrigation trenches on the side of the existing outfall.

Middleton-by-Wirksworth.—This village is now for the most part connected up with the Wirksworth sewer, thus removing the sewage from the gathering ground of an important public water supply.

BAKEWELL.

Great Longstone.—New sewage disposal works have been constructed to deal with the sewage of this village at a cost of approximately £5,000, including a new main sewer. The works consist of a detritus tank, two settling tanks, a filter and humus tank, together with a set of sludge beds.

BLACKWELL.

Tibshelf.—New scwage works have been constructed in Hardstoft Lane to deal with the sewage of the northern end of Tibshelf, and consist of two detritus tanks, settling tank, storm tank, circular filter, humus tank, and sludge beds,

CHESTERFIELD.

North Wingfield and Pilsley.—A new sewage disposal works is being constructed which will supersede the old works at Hillyfields and several septic tanks in the neighbourhood. The works consist of two detritus tanks, three settling tanks, two storm water tanks, three circular filters, and two humus tanks.

Hackenthorpe.—Two new sewage disposal works have been provided for the treatment of the sewage of this village. They are known as the "Hackenthorpe Main" and the "Brook Lane" works, and consist of the usual tanks, filter, and humus tank.

Shirland and Higham.—New sewage works have been provided during the year. The old works and two septic tanks will be superseded. The new works comprise two detritus, two settling, two storm, and two humus tanks, two filters, and several sludge beds.

New Tupton.—A scheme for new sewage works has been approved by the Ministry of Health. The old works will be scrapped and two septic tanks done away with. The new scheme is estimated to cost £6.585.

CLOWNE.

An application for a loan of £12,200 for various improvements to the sewage works at Hodthorpe, Barlborough, Clowne, and Creswell did not receive the sanction of the Ministry of Health,

HARTSHORNE AND SEALS,

Overseal,—New sewage works have been provided at Overseal, Most of the village has been re-sewered and a pumping station constructed at Gorsey Leys. The new works consist of two detritus tanks, two settling tanks, a storm water tank, two circular filters, and two humus tanks. Four separate outfalls have been done away with by this scheme.

Hartshorne.—A scheme for the provision of sewage works for this area has been proposed, but has not yet received the sanction of the Ministry in respect of a loan of £16,800. The area included in the scheme consists of Mill Pool, Mill Lane, Ticknall Lane, Spring Hill. Church Hill, Goseley Dale, and Goseley Mount. The scheme in the first place also included the laying of a sewer up to Midway, but this portion of the scheme was dropped.

SHARDLOW,

This Authority has taken advantage of the Government grants in connection with the provision of sewage schemes in the district, and has therefore been able to provide for the treatment of the sewage of several villages which would otherwise not have been carried out for some considerable time. The District Council has an arrangement whereby any excess over 1s, in the pound on the special rate for the half year in any parish is borne by the Rural District as a whole.

Breadsall.—The sewage of this parish is taken to the Little Eaton sewage works, which have been extended to deal with it,

Drayeott and Breaston,—Progress has been made with the enlargement of the sewage works here by the addition of two circular filters, a humus tank, and five sludge beds. A new air compressor station with a twin 100-gallon ejector is being provided at Breaston. The effluent from the works is now taken direct to the River Derwent by a long length of 12" piping, thus avoiding the use of a ditch alongside the main road. The estimated cost of the work is £9,300.

Melbourne.—The provision of new sewage disposal works for this parish is in progress: the estimated eost will be £14,500. In addition to the usual treatment works, there will be two small electrical pumping stations, one near Ticknall Road and another at the lower end of Penn Lane. The sewage of Kings Newton will be picked up and taken to the new works. Four separate ontfalls now in use will be abolished.

Stapleford and Sandiaere.—The new sewage disposal works for this joint area were completed during the year, consisting of tank and filters, with an electrical automatic pump as relief to the old gas engine. An extra electrical pump is also available for storm water.

Stanley.—Extensions have been made to the sewers in the Klondike and Sough Lane area and a pumping station erected in Sough Lane.

Shardlow and Aston.—A combined seheme for these two areas is in progress, consisting of two detritus tanks, two settling tanks of the inverted pyramid type, two storm water tanks, two circular filters, two humus tanks, and twelve sludge beds. The sewage has to be pumped by three pumping stations.

Chaddesden.—The existing sewage works for this area are being eonsiderably enlarged. The extensions include four detritus tanks, two settling tanks, two storm water tanks, four circular filters, one humus tank, and fifteen sludge drying beds. A new sewer is being laid in Meadow Lane and an automatic electrical pumping station erected to lift the sewage from this low-lying area to the sewage works.

Littleover.—Work is in progress on the new sewage treatment seheme for Littleover. At present the sewage from most of this area goes into the Derby Borough sewers, for which service an annual eharge of £845 is made. The scheme will relieve the surcharging of the Borough sewer which passes via Suuny Hill and Alvaston, A portion of the sewage of the Derby Borough area will be dealt with at the new works, which will eonsist of two detritus tanks, two settling tanks, two storm water tanks, four circular filters, and two humus tanks, with the necessary sludge drying beds. The report on the Ministry of Health inquiry is given on p. 68,

Spondon.—The enlargement of the existing sewage works is in progress, the additions being a detritus tank, a settling tank, two circular filters, a humus tank, and six extra sludge beds.

SEWAGE EFFLUENTS.

During the year 1931, 471 samples of sewage effluents were collected and analysed. The samples were classified as follows:—

Good	•••	•••	 237
Satisfacto	ry		 128
Unsatisfac	etory		 49
Bad			 57

The results of the analyses are sent to the Engineer or Surveyor concerned, and, where necessary, special letters are sent pointing ont defects existing at the works or making suggestions for effecting improvements in the condition of the final effluents.

SCAVENGING.

Reference to page 117 of the Annual Report for 1930 shows how scavenging is undertaken in the various Districts in the County. From the Reports of the Local Medical Officers for 1931 which I have received up to the date of printing this Report, I find the following alterations have taken place:—

CLAY CROSS URBAN. Now earried out by Council's workmen only.

Belper Rural. Allestree, Darley Abbey, Duffield and Quarndon by direct labour.

Denby, Dethick, Lea and Holloway, Kilbourne, Mapperley, Milford and South Wingfield by Contract.

Crieh, Holbrook and Horsley Woodhouse by householders.

BLACKWELL RURAL. South Normanton, Blackwell, Shirebrook, Searcliff (part), Pleasley, by Council.

Pinxton and Tibshelf by Contract.

Searcliff (part), Ault Hueknall, Glapwell and Upper Langwith, by private owners.

Chapel-en-le-Frith Rural. Bamford, Chapel-en-le-Frith, Chinley and Bugsworth by Council.

Ро.	Sept. 25	£37,230	Sewerage and sewage disposal of Littleover	Work in progress
Do.	Aug. 7	£10,090	Sewerage and sewage disposal of Spondon	Work in progress

SCHOOLS.

The number of schools closed during the year on account of infectious diseases is given in the following Table. It will be seen that the number closed was the same as that during the previous year. One school was closed by the School Medical Officer and 21 by the Local Sanitary Authority.

Shirebrook.—Consequent upon the special inspection of this District by the County Sanitary Staff in 1930, 321 of the 519 houses inspected had been put into a state of repair by the end of 1931.

INSPECTION AND SUPERVISION OF FOOD.

MILK SUPPLY.

Eight licences for the production of Grade" A" milk were issued during 1930 under the Milk and Dairies Amendment Act, 1922.

MILK & DAIRIES (CONSOLIDATION) ACT, 1915 AND TUBERCULOSIS ORDER, 1925.—The procedure set out in the Survey Report for 1925 has again been followed during the year. The work done during the year under the Act and Order is set out below:—

Animals slaughtered under the Tuber- culosis Order	429
No. with advanced tuberculosis	363
No. with tuberculosis, but not advanced	65
No. not tuberculous	1
Milk samples examined	1,156
,, found positive on direct examination	48
,, found positive on inoculation	138
" found negative on inoculation	970

Table XXVIII. gives statistical particulars relative to the examination of milk for tuberele made in the County Laboratory during the period 1926-1931.

The samples referred to were sent in under the Milk and Dairies (Consolidation) Act, 1915. They were received principally from the Local Authorities in the County of Derby, including the County Borough of Derby and the Municipal Boroughs of Buxton, Chesterfield, Glossop, and Ilkeston.

Samples of milk sent in under the Tuberculosis Order, 1925, and therefore taken from sources already examined and found positive, are excluded from the Table. The Table gives an indication as to the prevalence of tubercle in milk taken in the ordinary course of sampling, whilst the figures given separately for each of the six years under review give an indication as to the effect of the Tuberculosis Order in the elimination of tubercle from milk. With only six annual percentages on which to base an opinion, it is too early to be dogmatic on the effect of the Order, and all that can be said is that the figures for this County do not show the steady fall which reasonably might have been expected.

SAMPLING OF MILK. TABLE XXVIII.

	Mean aı	s of the res	pective qu 26-19 3 0.	arters		1931.				
		No. of completed examinations.	No. tuber- culous.	Per cent. of tuber- culous samples.	No. of samples.	No. of completed examinations.	No. tuber enlous.	Per cent. of tuber- culous samples.		
lst quarter	51.4	49.0	4.6	9.38	60	60	8	13.33		
2nd "	61.0	59.0	5.2	8-81	92	87	16	18.39		
3rd ,,	5 6·0	55.2	6.6	11.95	154	152	12	7.89		
4th "	73.4	71.6	7.4	10.33	157	153	10	6.53		
Mean annual —	241.8	234.8	23.8	10.13	463	452	46	10.18		

In order to show the annual increase or decrease. I set out the percentages year by year from 1926:—

		Completed	Number	Percentage
Year.	Ex	aminations.	Tuberculous.	Tuberculous.
1926		220	14	6.36
1927		223	27	$12 \cdot 11$
1928		172	23	13.37
1929		271	26	9.59
1930		288	29	10.07
1931		452	46	10.18

In my Report for 1925 I pointed out the desirability of disinfecting cowsheds after occupation by tuberculous animals and various other steps which could be taken to prevent the spread of tuberculosis, expressing the opinion, which I still hold, that slaughtering animals under the Act and Order without at the same time thoroughly disinfecting the cowshed or other premises in which the infected animals have been living is merely a half measure.

GRADING OF MILK.

On pages 78-81 there is an interesting report by the County Agricultural Organiser on the Clean Milk Competitions held in the County, from which it is clear that, in his opinion, some distributors of milk do not regard it as essential that the supply retailed is clean. There is no doubt, to my mind, that a considerable proportion of the general public do not demand clean milk, otherwise the retailer who did not supply the public's need would go out of business. To some extent, therefore, the public have themselves to blame. I say "to some extent" advisedly, for the average member of the general public who fails to understand the complicated standards of cleanliness used in designating milk is not entirely blameworthy. Everybody who has given the matter consideration is agreed that it is time the grades of milk were re-christened. The use of the letters A, B, C, or the numbers I, 2, 3, has been proposed,

but it has been suggested that this would not be acceptable because there would be "a natural aversion to any system which allows one grade to east reflections, as it were, on another "—a remarkable sentiment, and unintelligible to me if it does not mean that any simple form of grading comprehensible to the man in the street would be unpopular with some milk dealers.

I have no sympathy whatsoever for the producer of dirty milk who puts an inferior article on the market, and, through the ignorance of the public, ean attain as high a price as that obtained by his more careful competitor. A large and increasing number of milk producers take considerable pains to offer clean milk to the public, who should appreciate their efforts. The bacteriological reports on 715 consecutive samples of milk taken in the ordinary course of delivery between November, 1930, and April 30th, 1932, is an indication of this.

For my purpose I am classifying the milks in a designation of my own, viz.:—

Group 1 ... Contains up to 15,000 bact, per e.e. Group 2 ... ,, 15,000 to 100,000 per e.e. Group 3 ... ,, 100,000 to 200,000 per c.e. Group 4 ... ,, over 200.000 per c.e.

Of the 715 samples examined, there were in

Group 1 ... 184 or 26 % Group 2 ... 302 or 42 % Group 3 ... 178 or 11 % Group 4 ... 151 or 21 %

Therefore, excluding the "Coli" test, no less than 79% of the milks fell within "Grade A" standard. The "Coli" test, however, shewed that of

Group 1, 18 or 10% contained "Coli" in $\frac{1}{100}$ c.c. Group 2, 70 or 23% do. do. Group 3, 23 or 29.5% do. do. Group 4, 77 or 51% do. do. do.

In other words, the greater the number of organisms the greater the chance was there that amongst those organisms would be found "coli," which is, of course, exactly what one would expect, and indicates that the "coli" test from this point of view is superfluous.

One could not, for this reason, condemn the "coli" test, but it needs careful consideration as to whether or not the test should be maintained when no less than 10% of milks having less than half the total number of organisms allowed in the highest grade of Designated Milk are positive to the test, and eonsequently would be condemned even as the third grade of milk, generally spoken of as "Grade A Milk,"

My figures suggest that the so-called "coli" test savours too much of a "dip in the lucky bag," and therefore weighs disproportionately against the clean producer. The name "coli" in connection with this test is unfortunate and misleading, the test merely indicating the presence of some member or members of a

large group of organisms of uncertain origin which ferment lactose with the production of acid and gas.

The figures also suggest that, with reasonable care, counts of very considerably less than 200,000 per c.c. are obtainable, and are in fact obtained by four out of five producers, in the ordinary way of business.

CLEAN MILK COMPETITIONS.

This year the usual competitions for clean milk were continued, under the organisation of the County Agricultural Organiser, Mr. J. R. Bond, M.Sc., who reports as follows:—

In the course of the clean milk competitions which have been conducted annually in Derbyshire for several years, the various sources of possible contamination have been studied, and information on the subject has been disseminated widely among milk producers in the County. Several hundred farmers have themselves had the experience of attempting to produce super milk and of learning, from the detailed laboratory reports furnished after each sampling, to what extent the bacterial content and keeping quality of milk may be influenced by cowshed and milk-house methods.

While farmers have shown such interest in the subject, however, the majority of the purchasers of milk have made little advancement. One of the largest distributing concerns in the province still satisfies itself with the filter-pad test, which perpetuates the idea among producers that the sieve is an aid to clean milk production. There are other distributors, however, who make no regular tests of any kind; indeed, few farmers who offer clean milk are able to find a purchaser willing to discriminate in a practical manner between one dairy and another.

In contrast with the general attitude of milk distributors, certain buyers now recognise that it is not only equitable, but also good business to purchase their supplies on a quality basis. The effect of a bonus or penalty of $\frac{1}{2}$ d, per gallon is amazing. Specific cases could be recited of parishes where neither sanitary inspection nor educational effort had been very successful until the introduction of a bonus scheme, which immediately caused producers to interest themselves in modern methods and to enter the county competitions.

There is no doubt that wholesale purchasers could have an immense influence on the hygienic quality of milk if they would adopt the principle of payment according to quality. This is not quite the same as the neck-stretching scheme of certain firms which purchase milk produced in Derbyshire. The scheme here criticised is that of awarding a bonus of $\frac{1}{2}$ d. to 1d. per gallon to the ten or twenty producers highest in the list as drawn up in accordance with the results of the fortnightly or monthly test.

An equitable scheme should entitle the producer to a graduated bonus for the production of milk superior to an acceptable standard, and a penalty should be similarly imposed for failure to attain that standard. The adoption of Grade A figures as the basal quality for this purpose could not be considered to favour the producer. Marks might be awarded for each weekly or fortnightly sample on a simple scale, such as the following:—

Bacterial Cor	int.	B. Coli Test.	
	Marks	3	Marks
Under 30,000	100	Absent in 1 e.e	100
30,000—100,000	\dots 75	,, -1.0 e.e	75
100,000—300,000	50	$\frac{1}{100}$ c.c	50
300,000-600,000	$\dots 25$	$,, \frac{1}{1000}$ e.e	25
Over 600,000	0	Present in Toon e.e.	0

The bonus might then be paid or the penalty deducted from the standard price per gallon as follows:—

Marks	Bonus	Marks	Penalty
100	0d.	100	0d.
125	 <u></u>	75	
150	$\hat{\mathfrak{z}}$ d.	50	1d.
175	$\frac{3}{4}$ d.	25	$\frac{3}{4}$ d.
200	Îd.	0	Īd.

The larger distributors could reasonably be expected to provide laboratory facilities for such tests, and smaller retailers might join in making arrangements for laboratory work.

In the 1931 competitions, 63 competitors entered, 16 being in the County Championship Class, 13 in the Small Herds Class, 19 in the Large Herds Class, and 15 in the Chesterfield Retailers' Class, The following are particulars of samples taken:—

В	acterial coun	ts with		
Ce.	rt. standard.	Grade A. standard.	Ungraded.	Total.
County Championship	65	18	11	94
Small Herds	14	15	47	76
Large Herds	36	23	53	112
Chesterfield Retailers	20	26	44	90
Totals	${135}$	82	- <u></u> 155	$\frac{-}{372}$

The following is the report of the Inspecting Judge:-

Inspecting Judge's Report.

At the invitation of the Agricultural Organiser, I was privileged to act as Inspecting Judge of the Derbyshire Cleanest Milk Competition, 1931. As in previous years, the farms visited were judged by a score eard system, the marks being awarded entirely on the methods used in the handling of the milk. Fourteen farms were judged—seven in the Championship Class, three in the Small Herd Class, and four in the Large Herd Class.

Management of Cowsheds and Cows.

The cowsheds on most of the farms visited were not of model construction, but in every instance walls and partitions were whitewashed, and the cleanliness of the floors evidenced daily attention. In most cases the adjoining yards and drains were kept clean and

the dung removed to a reasonable distance from the cowshed itself. The importance of the latter factor in freeing the cowshed and its surroundings from risks of heavily contaminated dust and flies must not be overlooked, especially during the summer months.

On most of the farms visited, the cows' udders were thoroughly washed, but thorough washing of the flanks was only practised in a few instances. Many of the farms had, however, realised the importance of damping the flanks in order to prevent dust and hair falling into the milk. The pails and cloths used for this purpose were not as well cared for as one would desire. It is evident that little benefit can accrue from washing cows with dirty cloths and pails. Whilst it is important that these cloths and pails, heavily contaminated as they often are, should not be sterilised in contact with the actual milking utensils, it is absolutely necessary that some method of maintaining them in a hygenic condition should be adopted.

Clipping the udders was not very common, a factor which, when properly carried out, considerably reduces the labour involved in washing, and at the same time reduces the possibility of hair and dust from this source falling into the pail during milking.

Management of milk room and milking.

The milk rooms, in most cases anything but elaborate buildings, were kept scrupulously clean. One or two farms were cooling in lean-to sheds with open sides, a practice which must be deprecated owing to the possibility of contamination of the milk during this important operation.

With one or two exceptions, the utensils presented a clean appearance on naked eye inspection. On one or two farms there was slight suspicion of dried milk on some parts of the utensils, the farmers generally attributing this appearance to lime deposits during sterilisation. It was evident that, if such were the case, the lime has been allowed to accumulate, and the amount was in excess of the quantity to be expected after a single sterilisation. Boiling utensils in a copper or scalding utensils with boiling water are much more likely to produce this deposit than steam sterilisation, as by the latter method the steam will be free from lime. The presence of any deposit, especially dried milk on utensils, protects the bacteria from the sterilising action of steam or boiling water, and every effort should be made to prevent the accumulation of such deposits.

Steaming or scalding was practised on all farms visited, and there was every indication that the treatment was effective. The use of thermometers for checking the temperature of the steaming tank or of the water used for scalding was not as general as one would desire. It is impossible to specify any definite period of time for effective steaming where the temperature is not known, and several of the competitiors were of the opinion, and rightly so, that many marks had been lost on the bacteriological results owing to the

absence of a thermometer for checking the efficiency of their sterilisers.

It was very interesting to note that most of the competitors who were using boiling water for scalding utensils had realised the importance of performing this operation shortly before milking. Scalding cannot be depended upon to completely sterilise dairy utensils, and in hot summer weather any bacteria left are apt to increase in numbers at a very rapid rate if the utensils are scalded several hours before milking commences. This method has a further advantage where the farm copper is used, in that a supply of boiling water can be obtained for scalding utensils after the afternoon milking without re-lighting the fire, thus reducing fuel costs.

Milking and subsequent handling of the milk.

On every farm, dry-handed milking was practised, and the first few strips from each teat discarded. In most cases a separate pail was used for the latter operation. The practice of discarding the fore milk on to the floor must be deprecated both from an economic standpoint also as a possible means of spreading udder trouble and as a source of foul odours in the cowshed.

Where tubular coolers were in use they were taken full advantage of, and in every instance the rate of flow of the milk was so controlled that the difference between the temperature of the milk and that of the water had been reduced to a minimum.

Where cooling is carried out by standing the churns in a tub of cold water it is extremely important that the water be changed after the milk has been standing in it for about half an hour. If the water is not changed, its temperature is raised by the heat from the warm milk, and this results in the milk being maintained at a temperature extremely favourable for bacterial growth.

Conclusions.

It was extremely interesting to note the keen interest taken by Competitors in the Competition. It is evident that it was not merely a cup-hunting contest, there being a genuine effort to produce a clean article on commercial lines. The results of this and other Competitions in the past have definitely proved that Clean Milk can be produced on the average Derbyshire farm. It was furthermore, very interesting to note that in some areas the value of the cleaner article has been recognised by the trade, monetary inducement being given to encourage its production. It is to be hoped that in the near future milk buyers will give further financial recognition to the producers of the cleaner and better article.

In conclusion, I should like to thank the Agricultural Organiser and his staff for facilitating my visits to the farms and the Competitors for the courtesy with which I was received.

(Signed) A. ROWLANDS,

Inspecting Judge.

FOOD AND DRUGS (ADULTERATION) ACT, 1928.

Mr. John White, F.I.C., the County Analyst, reports on the work carried out under the Act, as follows:—

The collection of samples for analysis under the above Act is made by Sampling Officer William Etchells, who is a whole-time Officer, duly appointed by the County Council under the Food and Drugs (Adulteration) Act. In addition, he acts as Official Sampler and Inspector under the Fertilisers and Feeding Stuffs Act, 1926. His work is supervised by me as County Analyst and Agricultural Analyst, and he collects the samples day by day throughout the year. Arrangements are made whereby the County is covered as systematically as possible.

The following is a summary of the work done during the year 1931:—

Total samples	Percentage	Milk	Percentage.
analysed.	adulterated.	samples.	adulterated.
2075	1.6	769	$3 \cdot 1$

The average composition of the milk samples was as follows:—

Non-fatty		Total
solids.	Fat.	solids.
8.79	3.68	$12 \cdot 47$

THE PUBLIC HEALTH (PRESERVATIVES IN FOOD) REGULATIONS.

Under these regulations, the only preservative substance permitted to be added to foodstuffs are Sulphur Dioxide and Benzoic Acid, the addition being controlled by a Schedule stating the maximum amount of each which may be added to certain specified articles of food. Any article of food not included in the Schedule must be sold free from preservatives.

The whole of the samples of milk, butter, cream, and margarine were free from preservatives.

In addition to the articles named in the last paragraph, 399 samples of various materials were specially examined for the presence of preservatives.

The provisions of these Regulations appear to be well observed by traders in the County, and no serious infringement of these Regulations was found during the year.

Two samples of sausages contained Boric Acid to the amount of two grains per pound. The use of Boric Acid as a preservative is prohibited, and the vendors were so informed, and accordingly ceased its use.

A specimen of Lemon Squash contained three grains of Salicylie Acid per pint. This was found to be the last bottle of an old stock.

Fifteen samples of various makes of Crustless Cheese were specially examined for the presence of Tin, the maximum amount found being half a grain per pound, whereas two grains per pound is the generally-accepted permissible maximum.

Water.—The Urban and Rural District Councils in the County submit for analysis samples of water, under an arrangement made by the Public Health Committee, whereby they are analysed at nominal fees.

The number of samples received during 1931 was 155.

Samples of water, sewage cffluents, etc., are periodically submitted to me on behalf of the Public Health Committee, and general ehemical work is undertaken for the various Committees of the County Council, as required.

PREVALENCE OF, AND CONTROL OVER, INFECTIOUS DISEASES.

Notifiable Diseases.—The following Table, prepared from information given by the Local Medical Officers of Health and compiled at the request of the Ministry of Health, shews the incidence of notifiable diseases in the County during the year 1931:—

TABLE XXXII.

		Total Cases Notified.	Cases admitted to Hospital.	Deaths.

Smallpox.—The following Table shows the number of cases of Smallpox as given by the Registrar General during the years 1921—1931 inclusive, and shows that, although the disease is still prevalent, there has been a marked decrease in the number of cases notified during the last two years:—

1931		4,664

Scarlet Fever.—During the year, 951 cases of this disease were notified, of which four proved fatal, compared with 2,207 cases and seven deaths in 1930. The figures for 1931 give a case mortality of ·42, compared with ·32 the rate for the previous year.

Whooping Cough. 34 deaths occurred from this disease during 1931, as compared with 32 in 1930. The figures for 1931 give a death rate of .05 per thousand of the population.

Measles. The total number of deaths from Measles during the year was 27, compared with 56 in 1930.

Polio-Myelitis. During the year, 12 cases of this disease were notified. Three of these were investigated by the Orthopædic Surgeon.

TUBERCULOSIS SCHEME.

This scheme eonsists of two main units, viz., Dispensary and Institutional.

DISPENSARY UNIT.

The undermentioned changes have taken place in this service during the year.

Derby Dispensary.—In my report for last year I mentioned that this building, which is situated at the back of the New County Offices, had been taken over by the County Surveyor's Depart-

ment, and one room on the second floor of the New Offices used in its place. This room was unsuitable for use as a Tubereulosis Dispensary, and in June, 1931, it was found advisable to close it altogether. Portions of the area served by this Dispensary were taken over by other existing Dispensaries, and arrangements were made for the Tuberculosis Officer to visit patients in their homes who were so situated that they could not attend a Dispensary. At the time of writing this report, the County Council have sanctioned the provision of temporary accommodation for the County Surveyor's Staff, and it is anticipated that the late Dispensary will be re-opened shortly.

Ilkeston Dispensary.—This building was erected in 1914 by the County Council, the ground floor being used as a Tuberculosis Dispensary, and by agreement the first floor was let to the Ilkeston Corporation as a school clinic. In 1930 the Corporation desired an extension of the premises in order to provide additional school clinic accommodation. The County Council could not see their way to carry out the extension, but an agreement was reached whereby the Ilkeston Corporation purchased the premises from the Council for £800, leased the ground floor to them for a period of 21 years, and will carry out the extension they desire. Conveyance of the premises is in course of completion.

Dispensary Statistics.—Details of the work done at or in connection with the County Dispensaries, compiled from the returns required by the Ministry of Health under Mcmorandum 37/T, are given in Table T.I., and a copy of the return to the Ministry, showing in summary form the condition of the dispensary patients at the end of 1931, with the classification, and arranged according to the years in which they first attended, is given in Table T.II., pulmonary and non-pulmonary cases being shown separately. This summary shows to some extent the results of the Council's scheme for the treatment of tuberculosis.

TABLE T. II.—(a) PULMONARY TUBERCULOSIS.

Table showing summary of condition of Dispensary patients at end of 1931, and classification according to years in which they first attended.

WALTON SANATORIUM.

Accommodation is provided for 124 patients, there being 74 beds for males and 50 for females. An additional four shelter beds for males and six for females are available for use during the summer time. The former were new shelters provided during 1931.

Owing to the increase in the surgical treatment of pulmonary tuberculosis, the County Council appointed J. W. Tonks, Esq., of Chesterfield, as Consulting Surgeon at the Sanatorium as and from February 1st, 1931. However, I have to report with great regret that Mr. Tonks died suddenly on May 4th, 1931. F. J. Milward, Esq., was appointed his successor, and took up duty on July 20th, 1931.

The Medical Superintendent of the Institution, Dr. A. Niven Robertson, reports on the work at this Institution during 1931, as follows:—

Statistics.

324 patients admitted.

Males 176. Females 107. Children 41. 316 patients discharged.

Males 180. Females 103. Children 33.

Average number of beds occupied—125.

Average length of stay of the patients-145 days.

Average weight gained by the patients-10lbs. 202s.

Patients Discharged.

MINISTRY OF HEALTH CLASSIFICATION.

Radiant Heat and Cooling Power.

Three eases were treated by a combination of the radiant heat from a Ferranti radiator and exposure of the body to the cooling power of the atmosphere. All were advanced eases. One did very well, but the other two showed no improvement.

Artificial Pneumothorax.

Twenty-nine new eases (18 males, 11 females) were commenced on this treatment, and 21 old eases (12 males, 9 females) were continued. There were 534 re-fill operations, 5 gas replacements, 9 depneumothorax operations, and 9 pressure readings performed in the year.

There were 250 out-patients attendances for re-fills,

1931	29	21	534	5

1931 has been a record year for this form of treatment. Although one is resorting to A.P. treatment in a greater number and greater variety of cases, it is not a treatment to be undertaken lightly. Each ease must be considered carefully on its merits. Adhesions and fluid are the two bugbears of A.P. treatment, and when both are present the difficulties are doubled. Both increase enormously the care and work required in dealing with the case. Each refill in all cases requires eareful thought. Each case is a law unto itself on each occasion as to pressure, amount of gas required, time for operation and choice of operation, whether replacement, depneumothorax, refill or merely a safety pressure reading.

The beginning and end of an A.P. are both critical periods, both periods of danger to the patient because of the risk of lung puncture, the other cause of spontaneous pneumothorax into an A.P. eavity with its dire results. It is a mistake to make it a rule that all cases of eavity should be compressed. I have known patients live active lives for many years with a dry roaring cavity. It is often the last stage of fibrosis and natural cure. Such a eavity is as a rule adherent, and rupture of such a cavity into an A.P. space is usually fatal, and to do an A.P. in such a case may be courting a catastrophe.

I am of the opinion that in all cases, before starting on the $3\frac{1}{2}$ years course of an A.P. treatment, the risks of the treatment must be carefully weighed in the balance against the risks of progressive advance of the disease if the A.P. is not done.

Phrenic Evulsion.

This operation was performed by Mr. Tonks and Mr. Milward in three cases. In one case of chronic fibroid phthisis with cavity formation it caused marked improvement in diminution of toxæmia and lessened sputum. In a case of basal phthisis of the right side, which seemed just a case for this operation, no effect was produced. In the last case, one of a spontaneous pneumothorax occurring in a small pleural space left by an expanding obliterative A.P. and

causing a bronchial fistula, this operation was done with the hope of closing the opening; but it has had no effect.

Dental Treatment.

The Dental Surgeon in the year 1931 has done 305 dental extractions, 3 sealings, 2 fillings, 16 examinations, 6 easings, 1 syringing of socket, and 2 denture fittings.

Aurotherapy.

Trial has been made of the drug Allochrysine. It is thioglyceryl-sulphonate of Gold and Sodium. It is much less toxic than Sanocrysin, and can be given into the muscles, and is therefore useful because the course of treatment can be continued at Dispensary without difficulty.

Out of the nine cases treated, seven were improved, and four of these much improved, and in only two no signs of improvement. In all cases ordinary treatment had been tried without effect before the Allochrysine started. The final impression of the effect of this drug is therefore favourable.

Cases admitted for Diagnosis.—Twenty-one such cases were discharged from the Institution during the year, with the following results:—

- 6 were found to be suffering from tuberculosis.
- 4 had bronchiectasis.
- 1 had chronic bronchitis.
- 1 was a case of silicosis.
- I was a case of chronic interstitial nephritis.
- I was a case of cystitis.
- 5 were free from disease.
- I was a doubtful case of pulmonary tuberculosis.
- 1 was a doubtful case of tuberculosis of the intestines.

In only two cases Lipiodol was used for the purpose of diagnosis. In both, the cricothyroid route was chosen, as it is the only aseptic method available. The field of usefulness of Lipiodol in respiratory disease is small.

X-Ray Work.

542 X-ray photographs were taken in the year and 539 screenings were done in artificial pneumothorax cases. With an increase in A.P. work, there must be also an increase in the number of X-ray photographs taken, because the finer and most dangerous adhesions are often invisible by screening only.

Laboratory Work.

1,256 sputums and 1,357 urines were examined in the year. There were 19 blood sedimentation tests, 19 arneth counts, and 19 precipitation tests. There were eight differential blood counts and 55 blood sugar tests done, besides a number of cultures for diagnosis of throat swabs.

Meteorological Data for 1931.

Highest Wind	24.89	Feb. 11th.
Highest Dry Kata	60·1	Feb. 12th.

Highest Maximum Temp.		Aug. 4th
o e	74°F	*
Highest Maximum Temp.	74°F 22°F	Aug. 4th March 2nd, 6th & 9th,
Highest Maximum Temp. Highest Minimum Temp. Day of Maximum Hours	74°F 22°F	Aug. 4th March 2nd, 6th & 9th, Dec. 17th.

February had the highest cooling power (Dry Kata average 29.9), the highest cooling power by evaporation (Wet Kata average 57.3), and the highest average wind 8.8 miles per hour. July had the highest average temperature a 3 p.m., 63.1 Fahr, and the greatest amount of ultra-violet light. June had the highest radiant heat 76°, May had the most sunshine with an average of $5\frac{1}{2}$ hours a day, August had the most rain 5.67 inches, September the highest barometric pressure, averaging 29.59 inches, and November the highest relative humidity, 87.2%.

It was strange that the day of longest sunshine occurred so early in the season.

The relationship between gain and loss of weight of the patients and the cooling power of the air still seems to hold good.

General Remarks.

It used to be eonsidered that the only cases of pulmonary tuberculosis which repaid their cost by Sanatorium treatment were early cases which included most T.B. negative cases and T.B. positive cases of Stage I. Since the extended use of artificial pneumothorax treatment, unilateral eases of any stage must now be added to the above. Artificial pneumothorax has also a considerable preventive role in the control of tuberculosis. When one can remove from a household an advanced case of unilateral tuberculosis regularly coughing up much tubercle positive sputum and make his sputum either negative or much less in quantity, it is obvious that in this way much spread of infection is prevented by the artificial pneumothorax work done in the Sanatorium, The tables below show the number of cases of Stage II. and III., *i.e.*, cases beyond the early stage admitted to the Sanatorium since 1926.

TABLE D.S. V.

1926	110	49	159	44	70	100	170	50

The number of advanced cases admitted increased, as a matter of course, when the Barwise Ward was opened for advanced male cases in the beginning of 1927, but it is seen that in the year 1931 the number of cases admitted at a later stage of the disease is still further increased, and it is found that this increase is of the male cases. Apparently male patients are seeking help at the clinics at a later stage. This may be due to the economic crisis of the country, and the breadwinner does not wish to give up his work until he is absolutely compelled to do so.

Dr. Baskett showed that when wages are high the morbidity and mortality of tuberculosis is low, and when wages are low the morbidity and mortality is high.

Unless the patient seeks advice at the carliest sign of trouble in his chest, the results of Sanatorium treatment cannot be much improved except by a stay in Sanatorium longer than is apparently economically possible at the present time, and even then we are faced with the fact that this silent disease is often far advanced before the patient really feels that he is ill at all.

TABLE D.S. VII.

Condition of Patients discharged from the Derbyshire Sanatorium, Chesterfield, from 1915-1930 inclusive.

PENMORE PAVILION.

During the year this pavilion has continued to be used for the treatment of advanced female patients, under the clinical charge of Dr. B. S. Nicholson, the Tuberculosis Officer for the Chesterfield Area.

Fourteen beds are provided in the pavilion and four additional shelter beds are used when climatic conditions permit, two of the latter being new shelters provided during the year.

The admissions and discharges that have taken place during the year are as follows:—

TABLE P.I.

Patients	s in the Pavilion	n on th	ie 1st Ja	anuary	. 1931	•••	12

	Improved					20	
	No material i	improv	ement			7	
	Died in the I	Institu	tion	•••		11	
			Total	l		41	

The average duration of stay of the 41 patients discharged or who died in the Institution was $115 \cdot 3$ days, and the daily average number of beds occupied was $14 \cdot 1$, or $91 \cdot 1\%$ of the full capacity. The cost per patient per day for the year ended 31st March, 1932, was 7s. $1\frac{1}{2}$ d.

The average gain in weight of the 23 patients discharged as quiescent or improved was 7.2 lbs., the largest individual gain being 23 lbs. during a stay of 10 weeks.

Two of the patients were greatly improved, and were transferred to Walton Sanatorium to undergo ambulant treatment there.

An extension to the Recreation Room and the installation of electric heating to that room were carried out during the year at a cost of £73 10s, 0d.

The lawn laid down last season will be ready during 1932 for use as a rest station in the open for patients able to use rest chairs.

WHITWORTH HOSPITAL.

Six beds in a detached block are available at this Hospital for male pulmonary cases of the "hospital" type, under the clinical charge of Dr. P. Heffernan, the Tuberculosis Officer for the northwestern area of the County, The following admissions and discharges have taken place during the year:—

TABLE W.I.

Patients in the Hosp	ital on Jan	uary,	1931	•••		6
Admissions	•••		•••			17

Patients in the Hosp	ital on Dec	ember	31st,	1931		6
Condition of patient Quiescent of					6	
	*			•••	6	
No materia	*			•••	6	
Died in the	Institutio	n .	• • •	•••	5	
					17	

Of the patients discharged, two were transferred to Walton Sanatorium, and as a result of treatment in the Institution the working capacity of three patients was restored.

The average duration of stay of the 17 patients discharged during the year was 124.5 days, and the average number of beds occupied was 5.7, or 95 per cent. of the full capacity. The cost per patient per day for the year ended March 31st, 1932, was 6s. 7d.

Dr. Heffernan reports as follows:—

Institutional treatment of the "hospital" type of patient is a very effective measure in preventing or limiting the spread of infection. The value of the work done by the Whitworth Hospital block in this direction is proportional to the number of beds available. Within its limits, however, the block serves a very useful purpose.

BRETBY HALL ORTHOPÆDIC HOSPITAL.

Full particulars of this Hospital and the surrounding park have been given in previous Annual Reports, and, as extensions have been made, details of these have also been given. I do not propose, therefore, to give more in this Report than extracts from the Report of the Medical Superintendent, Dr. G. A. Q. Lennane, as follows:—

No extension to the hospital buildings took place during 1931, and the 147 beds available were in constant occupation. By the end of the year the waiting list had been considerably reduced.

Compared with the previous year, the number of admissions is slightly lower—174 instead of 182. This fact is more than accounted for by the opening *de novo* of 82 new beds in 1930. There were 58 more patients discharged during 1931 than in the previous year.

The results of treatment have been very satisfactory in all but a small percentage of eases.

In six eases of acute polio-myelities in which general practitioners sought the co-operation of the orthopædic scheme during the year, although the paralysis has been severe, no deformity has occurred, and any operation required has been for the purpose of improving function rather than for the correction of deformity.

Average length of stay of patients:-

T.B. Cases 473 days.

Non-T.B. Cases 186 ,,

All Cases 293

All the non-tubercular cases discharged during 1931 were improved either as regards correction of deformity, or, where this could not be accomplished, increase of function. It must be admitted, however, that the results of treatment in some cases of spastic paraplegia were disappointing. The reason of this lies, no doubt, in the fact that a few such patients frequently do not have sufficient intelligence to co-operate with those carrying out the treatment, such co-operation being of paramount importance.

During 1931 the following operations were performed:

Stabilisation of Foot	• • •	8
Open elongation of Tendo Achilles		9
Tenotomy and Wrenching		20
Wrenching alone		10
Tenotomy alone		10

Other Operations		•••	•••	5
	Total	• • •	• • •	173

All cases requiring such treatment received massage, electrical treatment, exercises and ultra-violet therapy.

A new and up-to-date X-Ray plant was installed at the commencement of the year, and has proved very satisfactory. 357 cases were X-rayed during the year, 782 radiographs having been taken. This number includes a few patients referred for X-rays from Swadlincote Clinic.

Infectious Disease.—Seventeen cases of whooping cough, seven cases of ring-worm, and two of scabies occurred during the year.

Splints.—The splint workshops were working at full pressure during the year, providing and repairing splints for the hospital and clinics. A start was made with the manufacture of celluloid splints by the staff of the plaster room, and the results were most successful. A total of 862 splints and appliances were made during 1931, as follows:—

Education.—The teaching staff was increased from three to four by the appointment of a student teacher in November, 1931. The Hospital is an approved Special School under Part V. of the Education Act, 1921. For full details of the work of the Hospital and School, reference should be made to the Annual Report of the School Medical Officer for 1930, pages 22-28.

Orthopædic Clinics.—In October, 1931, owing to various eireumstances, it was found desirable to close the clinics at Bakewell and Belper, and a new Orthopædic Clinic was opened at Matolek. This Clinic is held weekly, whereas the former two were held fortnightly. The change has proved very satisfactory from the point of view of both patients and staff.

The attendances at all the clinics were maintained.

The following Table shows the number of eases treated and the total attendances at the Clinies:—

OTHER INSTITUTIONS.

With the institutional accommodation now provided by the Council for the treatment of tuberculosis, only in exceptional cases is it necessary to admit patients to institutions not belonging to the County Council.

Four cases were admitted to such institutions during the year, three being pulmonary male cases admitted to the East Lancashire Tuberculosis Colony with a view to their becoming permanent settlers, and one gland case living at Glossop admitted to the Manchester Royal Infirmary for urgent operative treatment.

The following admissions and discharges have taken place during the year :— $\,$

Patients in the Instituti	on	s on Janua	ry 1st	, 1931	•••	1

NOTIFICATIONS.

During the year there were 692 primary notifications of all forms of tuberculosis as compared with 709 in 1930. Details of the age groups are given in Table T.VII.

A return is made each year to the Ministry of Health of the number of cases of tuberculosis that come to my knowledge otherwise than by notification. A copy of this return is given in Table T.VIII. It is gratifying to note that this number has decreased by almost 50% in the last two years.

The figures for 1929, 1930, and 1931 are 141, 107, and 71 respectively. In this connection it is interesting to observe that of the deaths reported to me during the year, 80.4% were notified before death as against 74.07% in 1930. This increased percentage is largely due to efforts made in the Central Office for the past few years to secure notification, wherever possible, and to the following up of deaths from tuberculosis of patients who have not been the subject of notification to ascertain why notification was not made in accordance with the regulations.

The efficacy of the Tuberculosis Scheme depends very largely upon the prompt notification of all cases of tuberculosis. There will, of course, always be a certain number of cases in which notification before death cannot be expected, but the figures I have quoted above show that notification is becoming more efficient.

336 deaths from tuberculosis were recorded by the Registrar General as having occurred in Derbyshire during the year 1931, but 342 deaths of persons suffering from tuberculosis came to my knowledge during the year. It should be borne in mind, however, that tuberculosis may not have been the primary cause of death in all these cases. The following table shows the sources from which information was received, the number notified under the Public Health (Tuberculosis) Regulations, and the percentage of cases so notified:—

PUBLIC HEALTH (TUBERCULOSIS) REGULATIONS, 1930.

These regulations, which came into force on January 1st, 1931, consolidated and amended the Public Health (Tuberculosis) Regulations of 1912, 1921, and 1924.

The special provisions relating to the notification of tuberculosis by School Medical Officers in the Regulations of 1912 have been rescinded and the new Regulations provide that notifications by School Medical Officers shall be made upon the form prescribed for other primary notifications.

Amongst other things, the form of quarterly summary, on which District Medical Officers forward to the County Medical Officer particulars of all cases of tuberculosis added to or removed from their registers was amended to give more detailed information. Table T.X. shews the number of cases of all forms of tuberculosis remaining on their Registers on December 31st of each year since 1924.

In this way it is hoped that more accurate records of the incidence of tuberculosis will be available.

SILICOSIS AND ASBESTOSIS (MEDICAL ARRANGEMENTS) SCHEME, 1931.

This Scheme, which came into force on 1st June, 1931, was introduced by the Home Secretary for the purpose of co-ordinating the medical arrangements under the different Workmen's Compensation Schemes for silicosis and to provide for workers engaged in certain processes in the Pottery and Asbestos Industries.

Before the introduction of this Scheme, the Tuberculosis Officers carried out initial examinations of new employees in these industries under the Refractories and Sandstone Industries (Silicosis) Schemes of 1925 and 1929. At the request of the Home Secretary, the

Tuberculosis Officers were permitted by the County Council to earry out examinations when required under the new Scheme.

During the year 1931, 46 examinations were earried out under the various schemes by the Tuberculosis Officers.

PUBLIC HEALTH (PREVENTION OF TUBERCULOSIS) REGULATIONS, 1925.

In my Report for last year I stated that a Local Authority in the County had prohibited a man, under these Regulations, from continuing his engagement in the milk trade, and that the man had elaimed compensation, but at the time of writing that Report the ease had not been settled. Eventually the matter was referred to a court of Arbitration, and an award of £75 was granted to the man. This was based on the loss of two cows in the man's possession at the time formal notice was served prohibiting his engagement in the milk trade. The man was a tenant of a small holding.

During the year, three persons suffering from tuberculosis of the respiratory tract and in an infectious state, who were engaged in the milk trade, were reported to me. The attention of the Local Medical Officer was drawn to these three cases, and in two instances the men gave undertakings not to continue the handling of milk. In the third case the man was shortly afterwards admitted to the Sanatorium, where he is still receiving treatment.

PUBLIC HEALTH ACT, 1925 (Section 62).

It was not found necessary to take any action under this Section during the year.

AFTER-CARE.

There are five After-Care Committees functioning in the County, viz., Chesterfield Borough, Glossop Borough, Ilkeston Borough, Long Eaton, and Ripley. Three of these Committees administer, on behalf of the County Council, the scheme for the provision of extra nourishment in their areas. Apart from this, the work of these Committees is purely of a voluntary nature—they raise money locally for the assistance of necessitous eases.

OTHER SERVICES.

Arrangements for the home visiting of tuberculous patients by the County Health Visitors, the provision of shelters, the granting of extra nourishment and the home nursing of bed-rdden eases of tuberculosis by District Nurses have been described in previous reports. The work done under these services is tabulated below:—

Homes visited by Health Visitors—

Dispensary Cases		•••	6,080
Other Cases	• • •	• • •	2,053

Total ... 8,133

Shelters.

During the year 20 new shelters were purchased at a cost of £11 5s, 0d, each. Four of these were issued to Walton Sanatorium, four to the Bretby Hall Orthopædie Hospital, and two to the Penmore Tuberculosis Pavilion, to provide extra accommodation during the summer time. The remainder have been loaned to suitable patients on the recommendations of the Tuberculosis Officers.

	Number of Shelters sold during the year		3
	Number in use at the end of the year		77

				1,010
Derbyshire S	anato	rium		1,065
Bretby Hall (Orthoj	pædie I	Iospita	1 782
				${2,857}$

The increasing importance of this branch of work is seen by the rapid growth in the number of patients X-rayed during the past 10 years—798 during 1922, 1,695 during 1927, and 2,857 last year. Apparatus which was capable of dealing with the small number of patients ten years ago has now become obsolete and out of date, and in some cases very dangerous to operate. Steps are being taken to replace the old apparatus at the Derbyshire Sanatorium and Derby.

Bacteriological Examination of Sputa.—The following Table shows the number of examinations of sputa for tubercle bacilli made in the County Laboratory during the year:—

BLIND PERSONS ACT. 1920.

At the end of 1931 there were 773 Blind Persons (413 Males and 360 Females) on the Register. Of these, 345 were in receipt of County relief at a total cost of £8,138 per annum. The average amount of relief per ease was 9s. 1d. per week.

During the year the Council have, by arrangement with the Derbyshire Insurance Committee, undertaken the domiciliary medical relief of necessitous blind persons in the County. The Derbyshire Insurance Committee arrange for treatment by the panel doctors, the charge to the Council being at the rate of 11s. 3d. per head per annum, i.e., 9s. for medical attention and 2s. 3d. for drugs and dispensing. On December 31st, 1931, 219 blind persons (72 men and 147 women) had chosen doctors under the scheme.

MENTAL DEFICIENCY ACTS, 1913 and 1927.

The Mental Deficiency Acts are administered in this County by the Mental Deficiency Act Committee. The number of eases dealt with and the action taken up to the end of 1931 are as shown in the following table:—

ORTHOPÆDIC NURSES-Miss M. E. GARRATT. Miss E. TAYLOR.

SCHOOL NURSES-

53 School Nurses are employed.

ANNUAL REPORT OF THE SCHOOL MEDICAL OFFICER, 1931.

To the Chairman and Members of the Derbyshire Education Committee.

LADIES AND GENTLEMEN,

I have the honour to present the Twenty-fifth Annual Report on the work of the School Medical Service in Derbyshire.

The work of the School Medical Department was continued very much on the lines of previous years, and although the economic position has made it impossible to contemplate any marked extension in the Service, it has been possible to keep up the amount and the standard of the work.

It will be noted that the school population is practically the same as last year. The total number of examinations of school ehildren out-numbers that of the previous year by 1,800.

The Dental Section has shewn a considerable increase of its work in all Departments. This has only been possible because the service has been maintained without frequent interruptions such as are caused by resignations and new appointments. During the year we sustained the loss of one very competent Dental Officer, Dr. Betty Hamilton, who has been appointed Dental Officer to another Authority.

I particularly draw your attention to that portion of the Report which deals with the subject of enlargement of tonsils and adenoids. It will be seen that I have taken steps, which may appear at first sight to be of a drastic nature, but these were only taken after three years of very careful consideration, during which I endeavoured to find justification for the large amount of operative work required of the County Staff. It will be evident from the text of the Report that I was unable to satisfy myself that many conditions previously considered to indicate operation were in any way benefitted, and not being amongst those who regard the operation of tonsillectomy and adenoidectomy as a trivial matter, I have taken what I think will be but a first step in the limitation of operations for these conditions.

It will be seen from the Report that this step was taken in May, 1931, when I definitely restricted the operation to certain conditions. Since that date, abler authorities than myself have published opinions which support me in my action. Actually whilst the

body of this Report was in the press, the British Medical Journal referred to a published series of Lectures on "The Conservation of the Lymphoid Tissue of the Upper Respiratory Traet," by Mr. T. B. Layton, Surgeon-in-charge of the Throat and Ear Department, Guy's Hospital, which shows quite definitely that his vast experience has taught him that there is an amount of damage done to children by depriving them of an important defensive mechanism—particularly important in young children. The British Medical Journal exhorts officers in charge of school clinics, and general practitioners, with whom rests the responsibility of deciding for or against operation, to read and re-read this pamphlet. I sincerely hope they will do so, and that there will consequently arise a generation of doctors and parents who will realise that it is not usually to the benefit of Humanity to allow Man to dispose where God has proposed.

I would like, in conclusion, to put on record my appreciation of the help I have received from the Education Committee and the Director of Education during the year, the latter half of which, in view of the economic position, has been a period of general difficulty. I am highly appreciative of the sympathetic consideration given at all times by the Education Committee to matters of medical importance.

I have the honour to be

Your obedient Servant,

W. M. ASH,
School Medical Officer.

New County Offices, St. Mary's Gate, Derby.

March, 1932.

SECTION 1.

NUMBER OF SCHOOLS AND ENROLMENTS.

The Derbyshire Education Committee is the Local Education Authority for the whole of the administrative County with the exception of the Boroughs of Buxton, Chesterfield, Glossop and Ilkeston, which are autonomous for elementary education.

The districts for which the Derbyshire Education Committee is responsible for the purpose of elementary education are set out in Table A, which also shows the number of schools and enrolments in each district.

The following table gives a comparison of the number of schools and enrolments in the Urban and Rural districts for the past six years:—

	Numb	er of Schoo	ls.	Enrolment.					
Year.	$Urban \ Districts.$	Rural Districts.	Total.	$Urban \ Districts.$	Rural Districts.	Total.

CO-ORDINATION.

Co-ordination between the various medical services in the County continues on the lines indicated in previous reports. The School Medical Officer is also the County Medical Officer of Health, and. wherever possible, the Assistant School Medical Officers are also Medical Officers of the Infant Welfarc Centres in their area. School Nurses also act as Health Visitors in their own districts. This leads to very close co-operation between the several medical departments. Any case suspected of suffering from tuberculosis is referred by the School Medical Officer to the Tuberculosis Officer, while severe crippling defects are transferred to the Orthopædic The Tuberculosis Officer and the Orthopædic Surgeon also notify the School Medical Officer of cases which they have discovered independently of the School Medical Service. A closer system of co-operation between the School Medical and School Dental services was instituted in the middle of the year in order to ensure that children suffering from enlarged tonsils and adenoids should have their teeth put in order before any other form of treatment was undertaken. This system is again referred to under the heading of "Tonsils and Adenoids."

Nursery Schools. The Education Committee has provided no Nursery Schools in the County area.

THE SCHOOL MEDICAL SERVICE IN RELATION TO PUBLIC ELEMENTARY SCHOOLS.

School Hygiene.—As in previous years, each Assistant School Medical Officer, on completion of the medical inspection of the children in the schools in his area, makes a survey of the premises and reports on any defects found. During the year 430 departments were inspected, and details of the conditions found are given in Table B below:—

TABLE B.

				Good.	Insufficient.	Defective and needs attention.
Cleanliness				 415	7	8
Heating				 423	6	1
Lighting				 412	17	1
Ventilation				 416	10	4

Washing Arrange	ements			 393	33	4
Cloak Room Arr				 421	8	1
Sanitary Arrange				 399	12	19
Playground	•••	•••	•••	 383	1	46

The serious defects in the sanitary condition of any department are at once referred to the County Architect. The following Table (Table C) shows the work done by the County Architect during

the last five years, part of which was undertaken as a result of the reports of the medical inspectors:—

TABLE C.

Medical Inspection.—The work of medical inspection is continued in the manner described in previous reports, and set out in detail in the Report of 1930. Each school is visited for the purpose of routine medical inspection and, as far as possible, a second visit for re-inspection of children found to be defective is paid later in the year. In addition to the visits of the Assistant School Medical Officer, the School Nurse attends each school from time to time to examine the children for personal cleanliness and verminous conditions. During 1931, each school received on an average 3.98 such visits.

- (a) The Age Groups inspected were those prescribed by the Board of Education (Special Services) Regulations, 1925. Statistical particulars of these routine inspections, together with particulars of special inspections and re-inspections, are given in Table I. appended to this Report.
- (b) Extent to which the Board's Schedule of Medical Inspection has been followed.—All inspection has been carried out in accordance with the Schedule of Medical Inspection of the Board of Education. The numbers of examinations made during the year are given below, with the comparative figures for the previous five years. It will be noted that there is a large increase in the number of re-examinations—an increase which is partly due to the careful and frequent re-examination of children found to be suffering from enlarged tonsils and adenoids:—

TABLE D.

FINDINGS OF MEDICAL INSPECTIONS AND MEDICAL TREATMENT.

Appended to this Report will be found the Tables prescribed by the Board of Education showing defects found at Medical Inspections during 1931 (Table II., Section A.); number of children found to require treatment (Table II., Section B.); whilst Group IV. of Table IV. shows the dental defects found and Group V. of Table IV. relates to uncleanliness and verminous conditions.

- (a) Uncleanliness. During the year, 155,270 inspections and re-inspections for this condition were made compared with 141,982 in 1930. Of the number of inspections and re-inspections made, 63,623 were of boys and 91,647 of girls. The number of individual children examined was 38,103 boys and 36,972 girls, and the number found to be verminous during the year was 2,056. This figure does not include children who were found to have one or two nits on one occasion only. Of this figure, 221, or 0.58%, were boys, and 1,835, or 4.96%, were girls.
- (b) Minor Ailments. Detailed returns of the incidence of defects found are set out under their respective headings in Table II. Table IV. (Group I.) shows a total of 4,137 minor ailments treated. Of these, 3,473 were treated under the Authority's scheme, and 664 otherwise.
- (c) Tonsils and Adenoids. During the year, 5,681 children were found to be suffering from enlarged tonsils or adenoids, 2,876 of them being referred for treatment. 1,970 cases of enlarged tonsils or adenoids were operated on by the Aural Surgeon, 656 received their operations elsewhere, making a total of 2,626 for the year.

The school population is 75,075. The operation rate for the year was 3.5%. This rate has steadily increased for many years, but if it remains at its present figure for the next nine years, approximately 31.5%, or nearly one third of the children leaving school will have been subjected to this operation.

The time has come to examine the merits and risks of tonsillectomy and adenoidectomy, and the conditions under which the operation is performed, reviewing first the opinion of the Board of Education and its Chief Medical Officer, the proportion of eases recommended for operation in Derbyshire over a period of years compared with the figures for England and Wales as a whole, the number of operations performed in Derbyshire, the conditions at the clinics under which the operation is carried out, and the steps that have been taken to ensure that no operation is performed unnecessarily.

A striking feature of the reports of the Chief Medical Officer of the Board of Education has been the constant reiteration for many years of warnings against the promiseuous removal of tonsils and adenoids, and the performance of operations under any but the best of conditions. In the 1923 report of the Chief Medical Officer of the Board of Education, the Board clearly defined its policy, which was adopted by the Section of Laryngology of the Royal Society of Medicine. It would not be out of place to quote the following sections from that report:—

"The School Medical Officer should take into consideration the following points:—

- (1) That the condition is not merely temporary, and may subside in due course. Even where there are signs of mechanical obstruction, and still more if there are signs of active inflammation, it is advisable for a time to suspend judgment, unless the character of the growth shows fibrous and permanent hypertrophy.
- (2) That the condition is not due to some cause (such as carious teeth or other disease or defect) which when removed will lead to subsidence of the enlargement.
- (3) That the condition is either causing or likely to cause injury to the child's health.
- (10) Wherever possible, all patients requiring operations for tonsils and adenoids should have in-patient treatment before and after operation. A stay of from twenty-four to forty-eight hours may be necessary, and a further stay if deemed advisable."

In 1928, again in the light of experience during the last five years, the following point, among others, was emphasized:—

"No child should be submitted to operation unless it is evident that non-surgical conservative methods would fail."

More recent investigation by Kaiser and others have thrown considerable doubt on the efficacy of tonsillectomy as a form of treatment for many associated conditions which had previously been considered indications for this operation.

The following table shews the proportionate numbers found at Routine Medical Inspection to require treatment for enlarged tonsils and adenoids, in Derbyshire, and in England and Wales as a whole. It will be seen that the figure for this county has been steadily increasing from 1926 to 1930—in the latter years being more than twice the figure for England and Wales.

TABLE E.

Tonsils and Adenoids referred for Treatment.

(Incidence per 1,000 Routine Inspections.)

		Derbyshire.	England and Wales.
1926	•••	89.8	54.6
1927		113.8	60.9
1928		118.7	63 ·0·
1929		143.7	66.8
1930		$140 \cdot 2$	66.5
1931	• • •	83 · 1	

Definite conclusions eannot be drawn from generalizations such as appear in the above table without due regard to local circumstances which may influence the figures. It may well be that the arrangements for treatment of these defects in this county are so accessible that there may be a tendency to refer for treatment cases that should more properly be subjected to a period of observation and conservative treatment.

As a result of the large number of eases recommended for treatment, the list of eases waiting to be examined by the Ear, Nose and Throat Surgeon grew to an alarming extent during the early months of 1931. In May, 1931, in order to ensure that none but the most urgent of eases were referred to the Surgeon without first an attempt being made to remedy the condition by conservative methods, a circular letter was sent to all Assistant School Medical Officers. These instructions were based upon the findings of the Medical Committee appointed by the Board of Education and upon the work done by Kaiser, who tabulated the results of operative treatment of 5,000 children in America one year after operation, and of 1,200 children three years after operation. An epitome of their conclusions is included in the following quotation from my circular issued on 29th May, 1931:—

"With a waiting list the size of the present one it is essential that only eases urgently requiring treatment should be submitted for operation, and as indications of urgency I suggest that obstruction giving rise to mouth breathing or interference with speech, constant colds in the head, sore throat and otitis are the indications for operation, and only eases showing these symptoms should be referred to the Aural Department at the present time."

"Investigation of large numbers of children appears to show that ordinary respiratory troubles of the larynx, bronchi and lungs are as frequent amongst eases who have had their Tonsils and Adenoids removed as amongst those who have not; that the ineidence of the common infectious diseases, with perhaps the exception of diphtheria, is not lessened by operation; there is little improvement in nutrition, generally speaking, amongst those treated, and it was only possible to claim that operation had improved those submitted to operation for mouth breathing, colds in the head, sore throat and otitis."

"It will be known to you that a diet lacking in Vitamins A and D is a possible cause of enlarged tonsils and adencids, that the presence of septic teeth is a predisposing factor, so also is mouth breathing."

"I therefore require that eases of enlarged tonsils and adenoids should be divided into those requiring urgent operation and that those who do not require operation urgently should be advised by the Assistant School Medical Officer as to proper diet, should be taught to breathe properly, and should have septic dental conditions remedied, but should not be recommended for operation until they have been subjected to re-examination by the Assistant School Medical Officer at a date not earlier than six months."

Subsequently a closer method of co-operation between the Assistant School Medical Officers and the Assistant Dental Officers was instituted, and a regulation was issued placing the responsibility upon the Assistant School Medical Officer of seeing that all cases suffering from enlargement of the Tonsils and Adenoids were referred to the dental department to be made "dentally fit" before further action was taken; if the condition was regarded as urgent, the patient was then transferred by the Assistant School Medical Officer to the Ear, Nose and Throat Department; if the condition was not urgent, there followed a period of at least six months observation and conservative treatment.

As a result of this alteration in procedure, the proportionate number of cases referred for treatment as shown in Table E has fallen from 140·2 to 83·1, although the scheme has only been in progress for six months. The number of cases waiting to be examined by the Specialist was 796 in September, and fell to 286 by the end of December. The following Table shows still more clearly the abrupt change which has occurred during the last year in the number of cases referred for treatment and the number placed under observation—some 1,000 cases being treated by conservative means which would otherwise in all probability have been sent direct for operation:—

TABLE F.

Total No. found Defective.									
		Referred for Treatment.	Referred for Observation.						
1927		3,031	2,170						
1928		3,724	1,986						
1929		4,108	1,584						
1930		4,336	1,862						
1931		2,876	2,805						

At the end of the year a report was received from each Assistant Medical Officer on the results of such conscrvative treatment as had been advised. It will be appreciated that the smallness of the figures is due to the short time that has elapsed since the institution of the new procedure, all the cases appearing in the following table having been observed for a period of at least six months:—

	Total.	$Had \ Operation.$	Cured.	Im- proved.	Un- changed.	Referred for Operation
No. of cases Percentage		20 6	34 10·2	58 17·3	128 38·3	94 28·2

These figures compare favourably with other observers; the Medical Committee of the Board of Education found 11 cases of adenoids out of 53 improved or eured after a period of observation, while Dr. Brewer (Swindon) found 26 cases out of 200 (i.e., 13%) cured or improved without operative treatment.

It is encouraging to see that almost as many cases of this group were improved by conservative treatment (27.5%) as were recommended for operative treatment at the end of the period of observation (28.2%).

TABLE G.
RECEIVED OPERATIVE TREATMENT.

	By	the County Surgeon.	Total (including Hospital, etc.).
1927		1,346	1,748
1928		1,466	2,043
1929		1,716	2,240
1930		1,742	2,316
1931		1,970	2,626

This table clearly demonstrates the rapidly-rising number of operations for the removal of tonsils and adenoids performed in this County. Owing to the large waiting list which has accumulated during the Spring of 1931 no diminution has taken place in the number of operations during that year. The rapid increase in the number of operations has reached astounding proportions when it is realised that these figures refer to a school population of only 75,075.

Moreover, it is realized that the arrangements for operations in this County are far from ideal. There are no facilities for keeping all children in for at least 24 hours after operation, and those who show no untoward signs leave the clinic on the day of the operation, frequently travelling long distances to their homes, where they may be remote from medical aid. The provision of in-patient facilities has been a matter of concern for some time, but so far there has been no solution to the problem.

At present operations for enlarged tonsils and adenoids are performed at clinics, namely:—

Alfreton. Ashbourne. Chesterfield. Chinley. Derby. Shirebrook.

It has been the practice for many years to belittle the risks of the operation, yet it must be realized that the sequelæ, as will be seen by a glance at the post operative complications published in these reports, though not common, are often alarming and sometimes fatal. In selected cases the operation is beneficial, but in unsuitable cases it does no good—in fact, it sometimes does a considerable amount of harm. It behoves those whose duty it is to advise parents, to try every form of treatment before embarking upon an operation which cannot be regarded as a trivial matter.

School children requiring institutional treatment for Pulmonary Tuberculosis are accommodated at the County Council's Sanatorium at Walton, where 20 beds are available for children. Cases of surgical tuberculosis are accommodated at the County Council's Orthopædic Hospital, Bretby, where there are 55 beds allotted for children under 16 years of age suffering from non-pulmonary tuberculosis.

The number of tuberculous children receiving treatment in the County Sanatorium during the year is shown in the following Tables:—

0.11 ' 0 '	Males.	Females.	'Total.

Doubtfully Tuberculous —

(e) **Skin Diseases.** Ringworm of the Body. Assistant School Medical Officers, at Routine Medical Inspection, found 20 children suffering from ringworm of the body, while 20 children were diagnosed elsewhere, making a total of 40, as compared with 52 last year. Of these, 38 were treated at the School Clinics and two received treatment elsewhere.

Ringworm of the Scalp. During the year, 32 cases of ringworm of the scalp were found at Routine Medical Inspection and 55 otherwise, making a total of 87 children discovered to be suffering from this disease, 84 of whom were treated under the Authority's scheme.

The Education Committee has two centres of its own for X-ray treatment of ringworm, one being at the County Offices, Derby, and the other at the County Council Clinic at Chesterfield. The work done at these clinics during the year is as follows:—

DERBY.	Total number of cases 13	
	Number of ringworm cases treated satis-	
	factorily by X-rays 11	
	Number treated by other means as scalp	
	was not in fit condition for X-ray	
	$ ext{treatment} ext{ } ext{ } ext{ 2}$	
CHESTERFIELD.	Total number of cases 23	
	Number treated by X-rays 18	
	Consultations only 3	

Scabies. 53 cases of scabies were discovered during the year at school medical inspection, 33 of whom were treated under the Authority's scheme.

Impetigo. During the year, 238 cases of Impetigo were found at School Medical Inspection, 583 being discovered otherwise, making a total of 821, of whom 804 were treated under the Authority's scheme, and 17 received their treatment elsewhere.

Other Skin Diseases. 192 cases were found at medical inspection to require treatment, 143 of whom were treated under the Authority's scheme.

- (f) External Eye Disease. 278 eases of external eye diseases were diseovered during the course of medical inspection. Of these, 157 were found to be suffering from blepharitis; 237 cases were referred for treatment. 278 cases were treated under the Authority's scheme and 95 otherwise.
- (g) **Vision.** In the course of routine medical inspection, 2,868 children were found to be suffering from defective vision, excluding squint, 2,026 of whom required treatment. 2,151 cases from all sources were referred to the Ophthalmic Surgeon for defective vision, including squint, 1,955 of these being treated under the Authority's scheme.

The statistical details of the work of the Ophthalmie Department are given in Tables "M" and "N"; other statistics are given in Tables III. and IV. at the end of this report.

Dr. Carr reports on the school Ophthalmic Services of the County as follows:—

"In surveying the Sehool Ophthalmic Service in this County, it may perhaps be of some value and interest to consider the ideals to be aimed at in such a service, to review the objects as originally conceived when the Service was inaugurated, to trace the steps in its development, and finally to estimate what it has achieved during its growth and in what respects it has failed.

The primary objects of a School Ophthalmic Service must be the preservation of sight, that is to say, preventive; and the amelioration of defective vision already existent, that is to say, eurative. The correction of refractive errors constitutes a preponderating proportion of the work of the ophthalmic surgeon, but it is by no means the most important. A correctly prescribed pair of glasses will improve a patient's vision, or enable him to use his eyes with greater comfort, and very often will do both, and may even have a remarkable effect upon his health and ability to profit by instruction, and thereby on the whole of his future career. But by treating a corneal ulcer and getting it to heal before it has done irreparable damage, or by operating on a cataractous eye, the oculist has the satisfaction of preventing blindness in the first instance and of curing it in the second.

When, some twenty years ago, I came to initiate a system of Ophthalmic Clinics under the direction of the late Dr. Barwise, it seemed to us that the development of such a scheme would fall

naturally into three stages. Firstly, as a basis, there would have to be a number of refraction clinics conveniently situated throughout the County. This was a prime necessity, as the Hospitals eould not possibly cope with the large number of cases requiring examination, and in fact many institutions were already refusing to deal with them. The next step would consist in the provision of a small number of major clinics, where more highly specialised work could be carried out, such as the treatment of inflammatory conditions, the supervision of orthoptic exercises for squint, and so forth. It was thought that centres at Derby, Chesterfield, and Chinley would suffice to meet the needs of this purpose. There was already a suitable Clinic at Derby and during the War the new buildings at Chesterfield and Chinley afforded an opportunity of establishing more elaborate centres. The plan worked well at Derby and Chesterfield where sessions were held weekly: these places were run on the lines of a Hospital Out-patient Department. It was not very successful at Chinley however. Not only were the intervals between the oculist's visits too long for treatment to be effectively supervised, but the situation was not a convenient one for serving a large area, as was the case in the other two places, and cases of serious ocular disease found it more practicable to obtain attention at the Hospitals in Manchester or Sheffield. The third stage would have consisted in the provision of small annexes, with a few beds, where operations could be performed, and urgent cases be retained for observation and treatment. Such an "Indepartment would be the logical corollary of the second or "Out-patient" stage, but it was destined to be never any more than a vision, owing to difficulties in accommodation and staffingin other words, expense.

At the present time it might appear that there has been a retrogression, as the out-patient development has been largely given up, but this would hardly be a fair way of regarding the situation. In actual fact, the school children of these days receive more prompt and efficient attention than formerly owing to the increasing cooperation between the Clinics and the Hospitals. It has been implied in a preceding paragraph that a case of disease requiring out-patient treatment may become more suitable for in-patient treatment, and the transference from Clinic to Hospital is disadvantageous owing to discontinuity of treatment and the change from one surgeon to another. What is now being done, therefore, is for cases requiring continued treatment to be referred to Hospital in the first instance. In mid and south Derbyshire this is particularly casy, as I can arrange for such patients to attend my department at the Derby Children's Hospital, or, if necessary, have them admitted straight away. Less urgent cases (e.g., requiring operation for squint, cataract, etc.) I can keep under observation from their first appearance at a Clinic up to the time of their admission to Hospital, which is, I think, an advantage to the patient and myself. Harrison Butler, in a recent paper on School Clinics, stressed the advantages accruing when the School surgeon is also a Hospital surgeon, and these have certainly impressed themselves upon me since I have been on the Staff of the Childrens' Hospital.

Although my work there is in theory quite distinct from my Clinie work, there is in practice a very close connection between the two, and a large proportion of my patients consists of children who have first seen me at a Clinic.

Before eoneluding this short review of the School ophthalmic service, I would like to add a rider. Several years ago I wrote that the problem of the squinting child was one of the most difficult that the ophthalmic surgeon had to face. This is especially so when one is dealing with large numbers of children distributed over an extensive County area. To discuss the whole squint question would require a volume, but it may be stated that the treatment of squint is by no means simple. Generally speaking, it comprises—

- (i.) Correction of refractive errors;
- (ii.) Orthoptie exercises;
- (iii.) Operation in certain cases.

Correction of refraction and simple exercises can be, and are, earried out at Hospitals and Clinies. Operation is, of eourse, a Hospital procedure. It is in the provision of the more advanced orthoptic exercises that failure is general at Clinies, at Hospitals, and in private practice. And yet a fundamental in the real cure of squint is the training of the latent fusion faculty. Unfortunately, this training involves the use of special and costly apparatus, and the engagement of experienced assistants, who must devote a considerable time at frequent intervals over each individual case. It must be admitted that the establishment of special Squint Training Centres to cope with even a fraction of our cases, which is the only true solution of the problem, is out of the question in present conditions.

Finally, I would like to mention one important class of defectives whose claims for special consideration are insistent, and for whom little is being done. I refer to the "Partially-sighted." The blind child as a rule does obtain admission to a Blind Institution, though often after delay and difficulty; but for the partially-sighted no special provision is made. The Blind Schools very rightly cannot receive them; the ordinary school is designed for normal-sighted, and the curriculum cannot be sufficiently clastic to meet the needs of these very special cases. Thus they are unable to obtain the education which is particularly necessary for them and from which they could profit to the full if presented to them by suitable means. This is one of the problems that call for attention when circumstances permit of an expansion of our educational system.

The cases seen during the past year are here shown under the usual headings of the conditions found at examination:—

- (h) Ear Diseases. During the course of medical inspection, 253 children were found to be suffering from discharging ears, 237 defective hearing, 134 other ear diseases. Further statistical details of the Ear, Nose and Throat Department have been tabulated under the heading of Tonsils and Adenoids.
- (i) **Dental Defects.** Of the 47,960 children inspected by the Dental Staff, 41,744 required treatment. 18,552 were actually treated, and 7,066 re-treated.

The statistical returns to the Board of Education shew a further increase in the Dental work for 1931. The following summary of work done during the preceding six years shews the extent of this increase and also the expansion of preventive dentistry which has taken place during that period.

Actually Attend-TeethTeeth Other Filled.treated. ances. TABLE O.

The following is a precis of the report of the Senior Dental Officer:

The progress made in this County is largely due to the increasing interest taken by parents in conservative dentistry, for success depends upon the co-operation of an interested and understanding public. As a result of modern conservative dentistry, I think it can be claimed that many hundreds of children now go through their school life without suffering from toothache.

Interesting reports have been received from Assistant Dental Officers, but, in view of the need for economy, it is impossible to reprint them in this report. From them, however, certain matters of interest are revealed; for instance, in one area, statistics were obtained which show a direct relation between the percentage of cases requiring a general anæsthetic for Dental treatment and the percentage of consents for conscrvative Dental work to be carried out. As an example, in one instance where the number of parents consenting to treatment at the time of the recommendation was low and the attendances at the Clinic were poor, no less than 32% of the children who finally came for treatment required a general anæsthetic, whilst in another area, where the parents and teachers were anxious for conservative Dental treatment, the cases requiring a general anæsthetic to enable adequate treatment to be carried out was only 8%.

One Dental Officer has remarked that parents in many instances appear to take more interest in their children's teeth below the

age of five than after that age, and appear more willing to consent for treatment to be carried out in infants than in older children.

In one area the Assistant Dental Officer points out the interference with the routine carrying out of conservative Dental work by what she speaks of as "casual patients," that is, those who are sent to the Clinie by the teacher or parent without an appointment, because at the moment they are suffering from toothache, and stresses the point that a very large percentage of these "casual" cases have refused conservative dental treatment recommended at a routine Dental inspection. Where the Staff is doing its utmost to cope with work for those who are anxious to accept dental treatment and who do. in fact, accept it at the time when conservative treatment is indicated, it is questionable how far the casual patient should be allowed to interfere with more important routine conservative work—for, though one admits the emergency in the ease of actual toothache, one is also bound to admit that, had the advice given been followed, there would have been no emergency at all. The disorganisation of routine work is illustrated by an occasion at a Clinic where notifications to attend had been sent out in sufficient number to provide the dentist with a full morning's work, but as many as 20" casual" cases attended during the session.

In one area of the County, which has had from the commencement of the County Dental scheme a fully-equipped Clinic and where inspection and re-inspection has been systematically carried out for a number of years, it was necessary to remove only 332 teeth of the permanent dentition, from a total of 2,485 children examined. Of these 332, only 231 were extracted on account of dental decay; the remaining 101 were removed chiefly for orthodontic purposes. The records for the children from whom the 231 teeth were extracted shew that in every case they had been recommended conservative treatment at an earlier period and had refused it.

During 1931 the County Mcdieal Officer inaugurated a scheme of co-operation between the dental and aural departments to effect that no child underwent an operation of tonsillectomy without first being made dentally fit.

From a large number of children referred by Assistant School Medical Officers for dental treatment prior to tonsillectomy or prior to a period of observation for enlarged tonsils, it was found that a great majority had refused dental treatment in the past, in fact, out of 540 such cases referred to the Dental Department, 444 had previously refused dental treatment or were school entrants.

(j) Grippling Defects. The Orthopædic Seheme consisting of the Central Orthopædic Hospital at Bretby and clinics functioning as out-patient departments in various parts of the County continue to work satisfactorily on the lines indicated in last year's report. The Orthopædic Clinics at Bakewell and Belper have been dis-

continued, and in place of them a Clinic has been instituted at Matlock.

TABLE Q.

NUMBER OF CHILDREN OF SCHOOL AGE (5—16) IN

HOSPITAL DURING THE YEAR 1931.

	Non. T.B. Cases.	Non. Pulm. T.B. Cases.
Children in Hospital on Jan. 1st, 1931 Admitted during 1931 Discharged during 1931 Children in Hospital on Dec., 1931	43 81 84 40	58 32 35 55

A full and interesting report has been prepared by Dr. Pierce dealing with Faulty Posture in School Children. It has not been possible to reprint the whole of it, but the following extracts demonstrate some interesting features of the study of this condition.

After emphasising the preventive value of school medical inspection in the recognition of the deviations from the normal in their early and tractable stages, Dr. Pierce goes on to say:—

The early deviations from the normal usually remain undetected for three reasons:

- " (a) Pain not being a factor, the attention of the patient is not focused on the affected part.
 - (b) Medical examination does not always pay sufficient attention to correct posture.
 - (c) The inherent unwillingness of parents to admit the existence of any but the grossest of physical defects in their children."
- "The general causes of habitual faulty posture may be summarised as follows:—Lack of muscular power due to constitutional weaknesses, lack of will power (laziness), too rapid growth, poor nutrition, the wearing of too heavy clothing, bad ventilation at home or in school, and unsuitable school furniture."
- "In the examination of 418 consecutive children over 12 years of age, 79 cases (or 18.9%) of scoliosis were found (scoliosis or lateral curvature of the spine is a deviation of the vertebrae from the mid line).
- "Medical advice as a rule is not sought in this condition until the child is older (girls about 16 years of age and boys 18 years of age), and by this time the deformity is more firmly established and more difficult to correct."
- "Occupation naturally plays a small role in childhood, but the two following cases are of interest:—
 - Case I. E.M., aged 12 when first seen; sturdy type of boy. Errand boy carrying milk.

Defect: Lateral deviation of dorsal vertebrae from mid line 1½ inches towards the left; right shoulder dropped two inches. He admitted always carrying milk with right hand. He was taught simple corrective exercises and persuaded to use the left hand for weight carrying as much as possible. The first six months saw considerable improvement, and at the end of two years his spine was absolutely straight when I viewed from behind. The boy and his parents took an interest in the cure.

Case 2. J. G., aged 12 when first seen. Worked on his father's farm. Tall, well-nourished boy.

Defect: Lateral deviation of vertebrae in mid dorsal region $2\frac{1}{2}$ inches. Right shoulder dropped $4\frac{1}{2}$ inches. Referred to Orthopædic Clinic, where he was taught remedial exercises. After six months, the spine was straighter and right shoulder then $2\frac{1}{2}$ inches lower than left shoulder. Twelve months after first examination, condition had retrogressed, spinal deviation being 2 inches from mid line and the right shoulder dropped 3 inches. In this case the boy and his parents were apathetic towards treatment."

"In the treatment of postural deformities, co-operation between the patient, parent, school teacher and Orthopædic Surgeon is essential, parental support being particularly desirable as success necessarily depends greatly upon home conditions.

Treatment comprises, amongst other things, the following:—

- (a) Correction of defects of vision and hearing.
- (b) Attention to throat and dental conditions.
- (c) Proper nutrition to improve general health.
- (d) Adequate rest.
- (e) Remedial exercises suited to each deformity.
- (f) Attention to the patient's sitting and standing posture in school.
- (g) The provision of orthopædic appliances where necessary.

Although some of the results of faulty posture have been particularly mentioned, it should be remembered that no part of the body can be wrongly used without adversely affecting the whole. Therefore, in considering posture, attention should be given to the body as a whole, not to any particular part, such as the back, chest, or foot.

Dr. Pierce concludes by pointing out the insidious onset of postural deformities, the ease with which most of them can be rectified by treatment in the early stages, and the difficulties of treatment if postponed till deformity has become marked.

BRETBY HALL ORTHPÆDIC HOSPITAL SCHOOL.

Bretby is an approved Special School under Part V. of the Education Act, 1921. The approval of the Board of Education dates from November 19th, 1928, when it was permitted to accommodate 40 children of school age for the purpose of giving active hospital treatment whilst their education received attention at the same time. There is a head teacher and 2 assistant teachers to attend to the educational side of the work of the special school

where instruction is limited to children between the ages of 5 and 16 years. There are two sessions daily, the morning session beginning at 9.30 and ending at 11.30; the afternoon session being from 1.30 to 3.30 p.m. Registers of admissions and attendances are kept. The Timetables, as approved by the Board of Education, and details of the work were set out fully in my Annual Report of last year.

Report of Head Teacher on School Work carried out during 1931.

Constant changes are inevitable in the planning and organisation of the work of teaching, which is carried on side by side with the medical treatment for which the children enter the hospital.

The duration of a patient's stay is uncertain, and the standard of work of new scholars varies according to the time the children have been out of school, and thus age is no criterion.

A pupil teacher was appointed in November. Two teachers now work in the Hall and two in the Pavilion Block.

The teaching staff is responsible for a branch of the County Library which caters for both staff and patients, whose appreciation is proved by a constant demand for more books.

The School was represented at the recent Exhibition of Cripples' Handierafts, held at Nottingham in November, where our exhibits included work of all kinds and grades. An opportunity was given to compare our work with that of other Hospital Schools.

SCHOOL CLINICS.

Full particulars of all the School Clinics were given in my Annual Report for last year. The following alterations have been made during 1931:—

(1) Minor Ailment Clinics.

An additional Minor Ailment Clinic has been opened at Staveley Middleeroft School, on Wednesdays, at 2 p.m.

(2) Ear, Nose and Throat Clinic.

Chesterfield Clinic is used for operations on the first as well as the second, third, and fourth Tuesdays each month. At Chinley, the Clinic is opened on the second Wednesday in each month for operations instead of the first Tuesday, and Derby Clinic has been discontinued on the second Wednesday in the month.

(3) Dental Clinics.

The Dental Clinic at Bakewell Liberal Club has been discontinued. An extra Clinic at Matlock, held on the fourth Monday in each month, has taken its place.

(4) Orthopædic Clinic.

As already indicated, the Bakewell and Belper Clinics have been replaced by an Orthopædic Clinic at Matlock.

ULTRA VIOLET LIGHT CLINIC.

In the Central Office there is a small Ultra Violet Light Clinic which has been used for some years for the treatment of children suffering from some temporary disability likely to be improved by heliotherapy. This clinic is only occasionally used during the winter months, and is closed during the summer. During the year, 10 children were treated, 4 suffering from enlarged glands in the neck, 3 from malnutrition, and 3 from discharging ears.

VACCINATION.

In view of the continued presence of Smallpox during the year, I again give the following Table shewing the vaccinal conditions of the children examined at medical inspection. This again shows an enormous and increasing percentage of unvaccinated school children in the County:—

INFECTIOUS DISEASES.

The arrangements for the detection and prevention of intectious disease continued to work satisfactorily. The present system of notification by the Head teacher to the Medical Officer of Health of the district and to the Central Office serves three purposes:—

- 1. Early knowledge of an outbreak of infectious disease in a School enables the Assistant School Medical Officer to investigate the epidemic and take steps to control it.
- 2. Information is obtained on which it is possible to certify that low attendance at the school is due to the prevalence of infectious disease, thus exempting that period of low attendance from the calculation in which the grant by the Board of Education is based.
- 3. When the question of school closure arises, it is possible to decide whether the school is the source of infection or whether the cause of the outbreak is to be found elsewhere, and whether school closure is likely to accomplish any check in the progress of the epidemic.

In the absence of accurate and prompt notification of infectious disease from the schools these three purposes cannot be fulfilled.

During the year many investigations into outbreaks of infectious disease were earried out by Assistant School Medical Officers. The following table shows the number of children examined by them in this connection:—

Chicken Pox				109
Diphtheria		•••		861
Measles				814
Mumps				410
Scarlet Fever		•••		216
Whooping Cough	1	•••	•••	28
	Tot	al		2,438

SCHOOL CLOSURE.

The number of schools closed by the School Medical Officer and by the Local Sanitary Authority on account of infectious disease is shown in Table S.

So many requests for school closure were received during the year that it is considered advisable to quote again the principles laid down jointly by the Ministry of Health and the Board of Education.

"It may be safely laid down as a general principle that if the power to exclude individual children be used to the best advantage, it is only in special and quite exceptional cases that it will be necessary to close a school in the interests of public health. School closure

may generally be regarded as an indication either of failure to make proper use of the more discriminating and scientific method of excluding individual children, or of inadequate co-operation between the Public Health and the School Authorities. It interferes seriously and unjustifiably, with the education of the scholars, and it deprives the Medical Officer of Health and the School Medical Officer of information respecting attacks in their early stage or illness of a doubtful nature which would be obtainable if the schools were kept open."

Judged by this sound standard it is rarely found that an outbreak of infectious disease warrants the closure of a school.

OTHER WORK BY THE ASSISTANT SCHOOL MEDICAL OFFICERS.

Special Visits to Schools. It has been found necessary from time to time to ask the Assistant School Medical Officers to visit schools to make investigations quite apart from the usual routine medical inspections and investigations into infectious diseases. The following Table shows the reasons for which such special investigations were made and the number of children examined:—

Malnutrition		•••	397
Mental Tests	٧	•••	40
Special defects	•••		13

MEDICAL EXAMINATION OF PUPIL TEACHER CANDIDATES.

There were 179 intending pupil teachers examined during 1931, 68 boys and 111 girls, with the following results:—

Number	$\mathbf{accepted}$	 	• • •	•••		Girls. 101	
	deferred for defects				2	10	12
					68	111	179

FOLLOWING UP.

The method of following up children found to be defective at routine medical inspection was fully described in my Annual Report last year. The change inaugurated in 1930 has developed into a very satisfactory system. Every defective child is followed up by a Health Visitor, and, if necessary, by an Assistant School Medical Officer. The number of home visits to School Children by Health Visitors amounted to 15,598 during the year.

The names of children not excluded from school for any reason yet absent for long periods are sent to the Attendance Officers, who are asked to arrange to have these children brought before the Assistant School Medical Officers for medical examination, following which the school nurse pays a special visit to the house of the child. If this is unavailing, or if for any other reason it is desirable, the Assistant School Medical Officer visits the home.

OPEN-AIR SCHOOLS.

Day Open-Air Schools. The type of school at present being built in Derbyshire, of which there are already 14 in existence, is constructed on open-air principles. A detailed report on the construction of these schools was included in my Report for 1929.

Playground Classes, etc. No comprehensive arrangements have been made for playground classes, school journeys, or open-air classes in Elementary Schools. Classes are, however, held outside in a good number of schools when the weather is suitable, but arrangements for these are in the hands of Head Teachers.

Further details on open-air recreation and camping are given by Mr. Hobson, the Organiser of Physical Training, in his report on pages 37-41.

PROVISION OF MEALS.

No meals were provided during 1931.

PHYSICAL TRAINING.

The report of Mr. Hobson, Organiser of Physical Training for the year 1931, is as follows:—

Frequent reference has been made in previous reports to the difficulty experienced in securing effective exercise indoors during long periods of inclement weather.

A solution of this difficulty in the elementary schools has yet to be found, but some progress towards a solution has been made in those schools which are furnished with flat-topped dual desks and chairs. Series of lateral, abdominal and dorsal exercises, which may be performed with the desks and chairs as supporting apparatus, have been demonstrated during normal visits of inspection. Stronger effects upon the trunk may be obtained by these exercises than by the free standing exercises taken in the playground, and, when they are supplemented by suitable arm and leg exercises, a more satisfactory indoor physical training lesson results. The recreational element can be secured by the inclusion of a few well-chosen "breaks" and simple ball practices.

Physical Exercises.

(a) Formal Exercises. The majority of teachers deal quite successfully with this section of the lesson. A bright, energetic introduction is generally followed by crisp, vigorous exercise. The starting, intermediate, and final positions of the exercises show that sound teaching has been given, and the selection of "breaks" and rhythmical movements is improving.

A speeding up of this section, however, may still be looked for, and further stimulation to maximum effort is possible.

(b) General Activities. Most of the teachers are now taking several group activities simultaneously, and in some cases the group leaders are receiving, in advance, a list of the activities to be taken by their respective groups. Leaders are thus given the opportunity of preparing the necessary apparatus, of planning team arrangements, and of giving instructions for the marking of pitches.

The choice of activities for group work leaves much to be desired, but the Organisers are emphasising the necessity for including in this section of the work progressive practices and minor games which definitely lead up to the major games

Such practices and minor games should teach progressively the habit of keeping the eye on the ball, the ability (1) to make a good pass, (2) to make a good catch, (3) to feint and "bluff" an opponent, (4) to place oneself in an "unmarked" position in readiness to receive a pass, (5) to "mark" an opponent, and (6) to recognise the "unmarked" colleague and to get the ball to him without "giving notice" to the opponents. With such training, and with practices to develop the peculiar skill required for each specific major game, the standard of play could be raised considerably.

Playgrounds. A steady increase has been noted in the number of voluntary school playgrounds which have been improved. In most of these, only gravel and chippings have been used to improve the surface, but a few playgrounds have been wholly, or in part, asphalted.

With very few exceptions, the playgrounds of the council schools have good surfaces.

The machine mentioned in the report for last year has been used for the permanent marking of a number of playgrounds, but in some eases only net-ball or tennis courts have been marked. In order to secure the marking of the playgrounds for activities which may be taken in the normal physical training lessons, the Organisers, during visits to the schools, are suggesting that plans for permanent markings be prepared and submitted to them for approval. When approved, these plans will be passed to the Committee's Architect, whose department carries out the work.

Organised Games. An increasing number of teachers are devoting the first ten or fifteen minutes of the games lesson to eoaching practices for the major games, which occupy the later part of the period. In addition to the games of football, cricket, and net-ball, one now sees teams engaged in Rugby touch, post-ball, seout, stoolball, rounders, and practices for athletic events.

Miss Hyden reports that "in scnior girls' schools the majority of the girls are now able to learn quickly any new game, and after a short time are able to play it with a reasonable amount of skill. Stool-ball has increased in popularity as a senior girls' summer game. Fielding—always a difficulty—has improved considerably."

"It is pleasing to report that in the rural areas, inter-school ecompetitions for girls are being arranged, the girls often playing a Net-ball or Stool-ball match at the same time as the boys are playing a game of football or erieket. Where the number of senior scholars is small, mixed teams play in the inter-school games."

Efforts have been made to ensure that playing fields should be grazed—preferably by sheep—or mown to keep them as suitable as possible for the playing of games.

The marking of pitches has been extended, and the Organisers have assisted head teachers in planning out the fields. Sawdust, whiting and soot are occasionally used for marking, but the more general method is to cut and turn over a "V" of turf.

The following playing fields are at present available for use by the schools:—

		• • •				
Rented by the L.E.A.						84
Recreation grounds and	fields	loaned	free	by far	mers	
and others						121
No. of Departments usin	g the	fields	• • •		,	329

Dancing. This is a most useful form of physical exercise, and is frequently used as an alternative to the games lesson, especially during bad weather. Miss Hyden states, in relation to dancing: "The good foundation in rhythm laid in the infant schools is enabling the teachers in the senior departments to include a wider choice of dances in their schemes. The laboured style frequently seen a few years ago has almost entirely disappeared."

Swimming. Interest in and enthusiasm for this branch of physical training has been maintained. 17 baths (three more than last year) have been used by 114 departments of schools, an increase of 15 upon last year. The additional baths are situated at Glossop, Marple, and Ringwood. near Staveley. Though these swimming lessons at these baths did not begin till the end or June, the results of the instruction proved to be very satisfactory.

The incidence of eerebro-spinal fever in several areas caused a number of schools to withdraw from the scheme of swimming instruction after only three lessons. 10 schools, attending the Bolsover (2), Creswell (4), and Tibshelf (4) baths, suffered this loss of instruction. The general results for the whole county, however, may be regarded as very gratifying. A total of 1.994 children have been taught to swim; 2,361 swimming proficiency certificates have been earned; 97 endorsements of first-class certificates for distances of a quarter of a mile or more have been granted; and 82 awards of the Royal Life Saving Society have been obtained.

The following tables show how the results of the year 1931 eompare with those of previous years:—

NUMBER OF SCHOOLS, PUPILS AND ATTENDANCES.

		No. of Schools	$\sim N$	o. of Pup	ils.	No.	of Attende	ances.

Of the children who could not swim at the beginning of the season, the number of learners (1,994) represents a percentage result of 41.8, as compared with 39.8 for last year and 41.2 for the year 1929.

The class teachers who have given some of the instruction, the 13 part-time instructors, and the nine part-time instructorses are to be complimented upon achieving such satisfactory results.

The total cost of the scheme of instruction for the year has been £1,244—13s. 1d., and the average cost of teaching a child to swim 12s. 4·8d. In arriving at this figure, the total cost of the instruction has been divided by the number of learners without taking into account the cost entailed in securing the progress of the swimmers to the certificate standards.

RESULTS REPORTED FROM THREE SECONDARY SCHOOLS.

No. of Learners. 3rd Class Cert. 2nd Class. 1st Class. Endorsements. Boys ... 85 39 39 21 21

No reports have been received as to the results obtained by the girls.

The members of the local schools' swimming associations have conducted the majority of the tests for the proficiency certificates. The Organiser is very grateful for this service.

Teachers' Classes. Two courses (one each for men and women) in physical training suitable for central schools have been held at Ilkeston. 46 men and 44 women were enrolled. Attendance was poor, due mainly to the prevalence of illness.

Arising out of these courses, gymnastic apparatus, made in the school handicraft centre, has been installed in the hall of the Long Eaton Sawley Road Council School. The apparatus comprises a double-boom with travelling centre upright, six balance benches, one vaulting box in sections, and one set of jumping stands. The total cost of this apparatus has been less than half of that quoted by the manufacturers of gymnastic equipment.

Camps. The Derbyshire Education Committee have offered assistance to 508 needy children to enable them to attend various eamps during the year.

Voluntary Associations.

1. The Derbyshire Schools' Camping Association has again done excellent work during the year under review. Camp holidays have been organised for 673 children, of whom 400 were boys and 273 were girls.

The composite camps for boys and girls were again held at Suttonon-Sea, and the four individual school camps at Lea Hill Farm, near Matlock, Eyam, Lea and Hope.

The activities of the association have been supported by the Education Committees of Derbyshire, Chesterfield, Ilkeston, and Buxton, and by the Ilkeston, Long Eaton, and Matlock Rotary

Clubs. A party of secondary school boys, from the Ernest Bailey School, Matlock, attended the composite boys' camp. This was the first occasion on which a secondary school had taken advantage of the organisation of the association, and the experiment proved highly successful.

2. The English Folk Dance Society (Derbyshire Branch) has continued to provide courses in each of the types of folk dancing, and the usual number of enjoyable parties and festivals has been arranged.

One new centre, with a membership of 40, has been formed in Ilkeston, and the courses held by the centre during the summer and autumn terms have been well supported.

The children's festival, held again in the Ripley Council Schools, attracted 83 teams—602 daneers. The standard of the dancing displayed in the various classes was high, and the adjudicators experienced much difficulty in scleeting the winning teams.

As most of the members of the branch are also members of the teaching profession, the benefits gained from the classes organised by the branch are earried into the schools.

- 3. Derbyshire Elementary Schools' Swimming Association. The County Championship and various local galas have demonstrated that the association is being successful in improving the style of the swimming of its members. Much coaching of scholars has been given after school hours by the members of the association, and, besides the improvement in style, 82 awards of the Royal Life Saving Society have been gained. Members who are examiners of the R.L.S.S. have conducted the examinations for these awards.
- 4. The Derbyshire Schools' Sports Association has had a very successful first year. County competitions in football, net-ball, and athletic sports have been organised by the respective sections, and a representative football team has played matches with the boys of Nottinghamshire. Owing to lack of funds, the County Schools' Athletic Team had to withdraw from the National Championship Competitions held at Reading in July.

The work performed by these voluntary associations for school children is invaluable and worthy of the highest commendation. The associations also give much help to the Organiser, who wishes to record his appreciation of all the assistance they have given him during the year.

In eonelusion, the Organiser wishes to express his thanks to the Education Committee and the Director of Education for their assistance, and to Miss Hyden and the teachers for their co-operation.

CO-OPERATION OF PARENTS.

All parents are invited to be present at Medical Inspections and during the year 14,774 or 38% of parents invited, attended. The attendance of parents at Medical Inspection is encouraged not only on account of the valuable aid which it gives to the School Medical Officer by information received from the parent regarding the child, but because he can give advice as to treatment, etc. direct to the parent, explain his reasons for giving such advice and dispel any doubts which the parent may have. Nothing but good can result from the meetings of School Medical Inspectors and parents, and such meetings have done much to add to the popularity of the service by giving it the necessary personal touch.

CO-OPERATION OF TEACHERS.

The co-operation of the teaching staffs of schools is very much appreciated by myself and the Assistant School Medical Officers. They help us very considerably in preparing for medical inspections, bringing forward special cases and following up cases recommended for treatment.

CO-OPERATION OF SCHOOL ATTENDANCE OFFICERS.

The closest co-operation continues to exist between School Attendance Officers and the School Medical Department, considerable help being given by the former in bringing cases of prolonged absenteeism due to ill health to the notice of the School Medical Officer. I would again like to thank Mr. Barnes, the chief School Attendance Officer, for the valuable help he has given me and my staff on so many occasions.

CO-OPERATION OF VOLUNTARY BODIES.

We continue to receive very valuable aid from The National Society for the Prevention of Cruelty to Children in bringing forward cases for medical inspection and in seeing that treatment is carried out where the home circumstances are unsatisfactory. The following cases were referred to this Society during the year:—

Children	reported to be	generally neglected	•••	4
Children		requiring medical	•••	3
Children	L .	refused medical	•••	1

BLIND, DEAF, DEFECTIVE & EPILEPTIC CHILDREN.

As I have pointed out in previous reports, the lack of institutional accommodation for Mental Defectives and Epileptics in the County is acute. Of 371 feeble-minded children, only 18 are in Certified Schools or other Institutions, and of 120 Epileptic Children, only 2 are in Certified Institutions.

Of 21 totally blind children, 5 are neither at school nor in an institution. Usually this is on account of the parents refusing to allow the children to leave home, at the same time undertaking to see that their education is attended to at home. In some cases, however, there are other defects apart from blindness, and as is usual in the case of combined defects, there is great difficulty in finding suitable accommodation.

With regard to the deaf and dumb children, only 1 out of 27 were at no school or institution.

SECONDARY SCHOOLS.

Inspection of Secondary School children was carried out as in previous years, in the manner described below. The number of children inspected is shown in Table IA, while the results of the Medical Inspection are set out in Table IIA, at the end of this report. The chief defects found are again defective vision, defective teeth, and enlargement of the tonsils. This year the Board of Education require a special report, furnishing information as to the nature and extent of the School Medical Service in connection with Secondary Schools, and set out a list of headings, under which the details are given below.

(1) Medical Inspection.

(a) The following table shows the number of schools in the County, classified as to whether they are provided by the County Council, aided by the County Council, or neither provided nor aided.

(i.) Secondary Schools provided by the County Council:-

			Enrolment.			
School.			Boys.	Girls.	Total.	
*Alfreton, Swanwick Hall			173	156	329	
*Belper, Herbert Strutt			209	205	414	
*Buxton, Cavendish High School	ol for	Girls	-	193	193	
*Chesterfield Girls' High			16	437	453	
*Clay Cross County			127	119	-246	
*Eckington Secondary			38	5 9	97	
*Heanor County			176	144	320	
*Ilkeston County			149	143	292	
*Long Eaton County			179	110	289	
*Matlock, Ernest Bailey			113	88	201	
*New Mills County			150	129	279	
*Shirebrook County School for	Girls	•••		66	66	

(ii.) Secondary Schools Aided by the County Council:-

	j	Enrolment.			
School.	Boys.	Girls.	Total.		
Ashbourne, Queen Elizabeth's Grammar	129	102	231		
Bakewell, Lady Manners	94	134	228		
*Buxton College	208	_	208		
Chesterfield Grammar	622		622		
*Dronfield Grammar	140	89	229		
*Glossop Grammar	127	111	238		
Staveley, Netherthorpe Grammar	224	153	377		
*Wirksworth Grammar	44	61	105		

(iii.) Secondary Schools neither provided nor aided by the County Council:—

Duffield, St. Ronan's (Girls).
Darley Dale, St. Elphin's (Girls).
Ockbrook Moravian (Boys and Girls).
Repton School (Boys).
Tideswell Grammar (Boys).

(b) Frequency and character of Medical Inspection.

The pupils at those schools indicated by a * in the above table are submitted to a full Medical Inspection annually.

- (c) Proportion of pupils inspected.

 All pupils attending these schools are inspected.
- (d) Arrangements for following up defects.

Defects found on Medical Inspection at a Secondary School are entered on the School Medical Record Card. Later in the year a second visit is made to the School, during which children found to be defective at the first visit are re-inspected to ascertain the progress of the defective condition, and whether or not adequate treatment has been carried out.

(2) Medical Treatment.

(a) Forms of treatment provided by the Authority.

The County Council provides treatment for Secondary School children at the Clinics for three types of defect—

- (1) Enlarged Tonsils and Adenoids.
- (2) Visual Defects.
- (3) Dental Defects.
- (b) Types of pupil for whom treatment is available.

The treatment for enlarged tonsils and adenoids and visual defects is available for all pupils attending Secondary Schools; the treatment of dental defects is confined to free-place pupils only.

(c) Arrangement for Recovering the Cost of Medical Treatment.

The County Council, in October, 1931, adopted a seale of charges for medical services, graded according to the financial circumstances of the patient's family.

In necessitous eases the charge of £2 for the operation of tonsillectomy is reduced according to the financial circumstances, the fee being recovered by the County Accountant's Department.

A fee of 1/6 is charged in the ease of dental treatment, this fee eovering the whole course of treatment, with the exception of an additional 1/6 when a general anæsthetic is required. This money is payable at the School Clinics. In eases of poverty the fee is reseinded.

In the ease of defective vision, the prescription for spectacles is usually handed to the parents, who obtain the spectacles privately, but in exceptional eases they are supplied at a fixed rate of 5/per pair. In necessitous eases, however, this rate is reduced and the balance of eost made up out of a voluntary fund known as the "Surgical Appliance Fund," collected at the Schools. Prescriptions provided under these conditions are not forwarded to the opticians until the appropriate fee has been received from the parents.

During the year 1931, 30 cases of enlarged tonsils and adenoids received operative treatment at the County Council School Clinies; 109 Secondary School children, after refraction at the School Clinies, were found to require spectacles; and 11 Secondary School pupils received dental treatment under the Authority's scheme.

EMPLOYMENT OF CHILDREN & YOUNG PERSONS.

The following Table gives particulars of the medical inspections under the Employment of Children Bye-laws.

SURGICAL APPLIANCE FUND.

An annual collection is made each year in December at the various sehools in the County and the proceeds distributed amongst the various voluntary hospitals in or near the County or paid into the Fund for the provision of surgical appliances and spectacles for necessitous cases.

For the year 1930-31, £529 9s. 10d. was collected, as compared with £515 5s. 10d. for 1929-30 and distributed as follows:—

			£	8.	d.
Surgical Appliance Fund .			 218	0	11
Derbyshire Royal Infirmary .			 91	7	7
Chesterfield Royal Hospital .			 42	3	1
Derbyshire Children's Hospital			 42	17	8
Burton-on-Trent Infirmary .			 23	12	0
Nottingham Children's Hospital			 10	6	3
Mansfield and District Hospital.			 14	5	7
Miscellaneous (less than £10 each	h)	•••	 86	16	9
			£529	9	10

Surgical instruments and spectacles for school children are also supplied from the above fund. During the year ended March 31st, 1931, the expenditure in this connection was as follows:—

Cost of surgical appliances				141		8
Cost of glasses provided	•••	•••	•••	238	15	10
				£380	9	6

Several demands have been made on the Surgical Appliance Fund by Secondary School Children, but it should be borne in mind that something over £500 a year is contributed to this fund by Elementary School children, whereas the Secondary Schools, with but one exception, contribute nothing. The exception last year was Ilkeston Secondary School, which contributed £1 15s. 0d. This has to be remembered in deciding whether or not Secondary School children should be entitled to draw upon a fund to which they contribute so little.

Nature of Surgical Appliances supplied during the year:—Calipers, iron and aluminium, Double Irons, Knock-knee Irons, Straight Frames and Saddles, Cock-up Splints, Block Leather Spicas, Back Supports, Leather and Celluloid Jackets, Boots raised with cork and Boots tubed and heeled, Abduction Frames, Walking Thomas Splint, Invalid Chairs, and repairs to Artificial Limbs.

BACTERIOLOGICAL EXAMINATIONS.

During the year ended December 31: Specimens were examined in the County La		
these are as follows:—		Negative.
Swabs for Diphtheria	7	114
Hairs for Ringworm		81
Urine for Albumin, etc	13	137

The work of Child Guidanee has been quietly developing in the County during the past year.

Cases have been seen regularly at the Matlock Clinie; and other eases, which were too far afield to come to Matlock, have been seen at Derby, Buxton, Chinley, Ashbourne, or visited in their own locality.

With the exception of the eases which were able to come to the Clinies as often as was necessary, the work has not been easy.

It is very difficult to maintain adequate contact with eases at the other end of the County, and to ensure both an accurate supply of information as to the progress of the ease and a satisfactory handling of new situations as they arise. On this account I have found it impossible to take on eases where I was not able to secure the adequate co-operation of the parents.

In view of the difficulties under which it has been earried on, I think the result of the year's work may be considered satisfactory. Of the 58 new cases seen, ten were found unsuitable for Child Guidance, either through lack of co-operation or for other reasons. In seven cases appropriate action, such as signing up for an institution, was taken. Of the remaining 41, 27 have been either apparently cured or are showing varying degrees of improvement, and 11 have not yet re-visited the Clinic to report progress. In the latter

case improvement may be presumed in several instances, as the parents were told to bring the children back at once if the symptoms complained of were not alleviated.

Only one case has proved thoroughly unsatisfactory so far, and, although distance is proving a difficulty, I am still hopeful of bringing this case to a successful conclusion.

As will be seen from the foregoing table, a wide diversity of conditions and behaviour problems has been dealt with. I give a few particulars of some of the more interesting ones.

L., a child of six, for some years had only had her bowels open once a week. This occasion was naturally one of great suffering for the child, and the condition caused great distress in the household. Various doctors had tried aperients of all sorts, but in vain, and the child's health was becoming seriously undermined.

The problem turned out to be psychological rather than physical. The mother, a pleasant but rather masterful woman, had been ordering the child's life far too much with a continual "Do this," "Don't do that," "Now come and do this," and the child was saying in effect, "You can control my eating, sleeping, playing, etc., but, anyhow, my bowels are my own!" In time, of course, the act became so painful that it was postponed as long as possible.

The treatment consisted of convincing the child by appropriate remedies that it was possible to have a painless motion and of persuading the mother to alter her attitude towards the child. This, plus a little treatment by suggestion, proved entirely efficacious, and the child—when last heard of—was having a motion every day.

M. H. is a little girl of four who for the last two years has been very nervous, sobbing for long periods with no apparent reason, frightened at anything and having fits of an apparently epileptiform nature. These fits, in which she complained of dizzmess, were particularly interesting in that they used to come on when she saw children running round in play, wheels going round, her mother stirring a pudding, or, in fact, circular motion of any sort. It is quite possible that some of these fits were genuine petit mal, but most of them were probably designed to oust her baby brother from her mother's lap; and things in circular motion served to remind her of this infallible way of attaining that desirable position.

The situation was explained to the mother; she was advised to take appropriate steps to allay the little girl's jealousy, and also to lay her on the sofa when she had a fit, instead of taking her on her lap.

The fits at once became less frequent, and last time I hear from the mother she wrote happily to say the child was very much better in every way.

B. C. A little boy aged eight absolutely refused to go to school. He was punished by the teacher and thrashed again and again by his parents, all to no purpose. Finally, a bigger boy was paid to

take him to school every day, but as often as not he contrived to give him the slip. When seen at the Clinic he was a pitiable little object, declaring that he had no love for his parents and that he hated school because he could not understand the lessons. His teacher, interviewed, said he was stupid and stubborn. On examination he was found to be a little above the average in intelligence, but distinctly deaf.

His mother admitted that she didn't care for him as much as her other two children, and that she was always on to him because he was so irritating. It was explained to her that the boy was suffering severely from lack of love, and she agreed to try a change of attitude. The boy attended the Clinic for some time, his deafness was cured by the removal of his adenoids, after which he was sent to stay with his grandmother for a few weeks. Finally—to break the old associations—he was transferred to another school, which he is now attending regularly and happily.

F. W. A little boy, aged six, has been suffering from persistent somnambulism for the last nine months.

The cause of his mental unrest eventually proved to be the chance remark of a playmate, that his mother might go away and live with a daughter and leave him with his father, "who shouts at him." He had never given the slightest indication to his mother that he had any such idea, and she was most surprised.

Once this fear had been brought to the surface and allayed, the somnambulism ceased.

F. D., a boy of twelve, was expelled from his Secondary School on account of stealing and general unsatisfactory behaviour.

In spite of the severe punishment, this conduct has persisted for over a year, and the parents were at their wit's end.

On investigation, it came to light that this boy had been brought up in his earlier years by his paternal grandmother, who had spoiled him considerably. When his mother took over charge of him she began to discipline him, and the boy, not liking the change, used to run into his grandmother's house whenever he got the chance, where the spoiling process continued.

The mother became jealous because the boy appeared to prefer his grandmother to herself, and the old lady was bitterly critical of what she considered the harsh treatment of the boy by her daughter-in-law. The boy thus became the battle-ground whereon these ladies waged their quarrel. He could do nothing right in his mother's eyes and nothing wrong in his grandmother's. The upshot of it all was that he began to misbehave, and by the time he was brought to the notice of the Clinic his conduct was causing the most serious concern to all who knew him.

It took a little time to sort things out, but eventually both the mother and grandmother were brought to an appreciation of the position and to a modification of their attitude towards the boy.

Sundry adjustments were made in his life, and a nasal obstruction was treated by the E.N.T. Dept.

The boy has been in no serious trouble since—he is happy in his home life, and though his work at school still leaves a little to be desired, he is a very different boy from what he was twelve months ago.

P. D., a Secondary School girl of eleven, was caught in the aet of shop-lifting. It is probable that this had been going on for some time, and there were other thefts at school which this child may have been responsible for.

On investigation, it was found that this girl's mother had died some years previously, since when the family had been living in lodgings.

Her father was on night work and rarely saw her, and there was no one to take interest in her or show her affection. She admitted that she could not remember anyone kissing her since her mother died.

The things she had stolen she had been giving away to school-fellows in a pitiful attempt to buy the affection which should have been her normal birthright.

In this ease, as in others, the diagnosis proved easier than the treatment; but, with the co-operation of her wise and understanding Headmistress, some progress has been made in re-adjusting her life, and we are quite hopeful that a really elever child will be saved from disaster and guided to a successful eareer.

STEALING.

Stealing is the type of delinquency most frequently met with in child guidance work, and over and over again in this connection the fact is emphasised that the motive, and not the crime, is the important thing. There can be no wholesale measures—each case has to be sifted to the very bottom and treated on its merits.

Stealing by children falls roughly into three classes :-

(1) Those who steal for the fun of the thing, *i.e.*, those in whom the excitement of the aet and not the value of the thing stolen is the real ineentive.

This type, of the orchard raiding variety, is usually carried out in eompany. It does not, as a rule, ineur for the offender the eensure of his fellows, and even if Authority has to deal with it, it often does so with the twinkle in its eye.

This type of stealing is usually amenable to ordinary disciplinary measures, and only when it is persisted in, in spite of adequate punishment, need it be regarded seriously.

One of the best ways of dealing with it is to get the boy concerned into a good Scout Troop or Cub Pack, where he will be able to satisfy his desire for exciting adventure in a legitimate way.

- (2) Those who steal to satisfy an appetite, *i.e.*, those in whom the attraction of the thing stolen is the ineentive.
- This is a more furtive type of theft; it is usually carried out alone, and, when it is discovered, earns for the offender both the eensure of his fellows and the heavy hand of Authority. Providing the child has not been brought up in an un-moral home, it chiefly indicates a failure of self-control.

In dealing with these eases, one has to realise that, as regards self-control, we all have our breaking-point; but with some it is much higher than with others. In cases such as these, where there is a very low breaking-point, we can help, not only by trying to strengthen the self-control, but also by temporarily easing the tension. For example, a child who steals sweets, jam, etc., may be doing so to satisfy an abnormal physiological craving for sugar, and, instead of depriving the child of sweets as a punishment and often accentuating the trouble, the better plan is to add more sugar and sweet food to the diet, and thus lessen the temptation.

In the same way, when a child steals money, instead of reducing the pocket money, it is often better to put the child in the way of earning a little more.

This mode of procedure may seem strange to those who think that crime should be followed by adequate punishment; but the whole object of any action is to turn the juvenile delinquent into a useful citizen, and not merely to exact justice; and if, as often happens in these eases, punishment fails to produce any improvement, it is better to have recourse to methods which are more psychologically sound.

(3) Children in whom stealing is merely a symptom of mental unrest.

It is a curious fact that children who are leading thwarted, deprived, or mal-adjusted lives often turn to stealing as an outlet for their pent-up emotions. In nearly every case of persistent stealing continuing in spite of threats and punishment, and particularly when the articles stolen are not of any particular value, one finds a psychological problem in the background. There may be tension in the home due to strained relations between the parents, there may be jealousy of another child, there may be antagonism to a stepparent, the child may be suffering from overwork, or from epilepsy or chorea, he may be passing through a difficult time as regards sex, or be just generally misunderstood. Any or all of these varying conditions frequently produce the same external symptoms—stealing.

These children are generally very miserable. They protest with tears that they "Don't know why they steal" and that "They can't help it," and they are usually speaking the truth. They are not unnaturally the despair of their friends, who foresce a very gloomy future for them; sometimes they appear before the Magistrates, and if probation fails, as it often does, they are sent to industrial schools. Nevertheless, they are really not potential criminals, but only misunderstood children.

They are essentially cases for the Child Guidance Clinie, and not infrequently clear up like magic after a short period of treatment. Success or failure depends very largely on whether the parents can be brought to appreciate the psychological points at issue, and to give them sympathetic co-operation.

A great many potentially respectable and trustworthy adults pass through a phase of misbchaviour as children, and it is far better that they should receive a little guidance through that difficult period than that they should be subjected to exposure, disgrace, and perhaps life-long stigma.
